

# Converting from generic to rnc coordinates

The following is based on the approach used in the `geodesic-bvp.tex` code. The main difference here is that this time we will *not* be assuming that the coordinates are in Riemann normal form. This will be apparent in the expression for the generalised connections – they will be expressed in terms of the partial derivatives of the connection rather than the covariant derivatives of the Riemann tensor. There will also be a change in the way the Taylor series are developed. In this case the expansion parameter  $\epsilon$  will be associated with the connection and its derivatives rather than the Riemann tensor. We will use

$$\Gamma^a_{bc} = \mathcal{O}(\epsilon) , \quad \Gamma^a_{bc,d} = \mathcal{O}(\epsilon^2) , \quad \Gamma^a_{bc,de} = \mathcal{O}(\epsilon^3) , \quad \text{etc.}$$

The generalised connections are defined recursively by

$$\Gamma^a_{bcd} = \Gamma^a_{(bc,d)} - (n+1)\Gamma^a_{p(\underline{c}}\Gamma^p_{bd)} \quad (1)$$

where  $\underline{c}$  contains  $n > 0$  indices. It is easy to see from this equation that the generalised connections will behave much the same as the connection, that is

$$\Gamma^a_{bc} = \mathcal{O}(\epsilon) , \quad \Gamma^a_{bcd} = \mathcal{O}(\epsilon^2) , \quad \Gamma^a_{bcde} = \mathcal{O}(\epsilon^3) , \quad \text{etc.}$$

This allows us to represent each generalised connection by a single expression (typically `GamNN`).

The situation is slightly different in `geodesic-bvp.tex`. In that code the connection and the generalised connection are expanded as a series in the Riemann tensor and its derivatives. Thus each connection is written in the form

$$\bar{\Gamma}^a_{\underline{c}_n} = \bar{\Gamma}^a_{\underline{c}_n}^{(0)} + \bar{\Gamma}^a_{\underline{c}_n}^{(1)} + \bar{\Gamma}^a_{\underline{c}_n}^{(2)} + \cdots + \bar{\Gamma}^a_{\underline{c}_n}^{(m)} \quad (2)$$

where  $\underline{c}_n$  denotes a set of indices such as  $c_1c_2c_3 \dots c_n$ . The terms of the RHS are each of a different weight in  $\epsilon$ .

## Stage 1: The generalised connections

The generalised connections  $\Gamma^a_{\underline{c}_n}$  could be computed directly by successive application of equation (1). But a more efficient method exists and its basis lies in the original definition of the generalised connections. Recall that the generalised connections arose when building a formal power series solution of the geodesic equation

$$0 = \frac{d^2x^a}{ds^2} + \Gamma^a_{bc} \frac{dx^b}{ds} \frac{dx^c}{ds} \quad (3)$$

The key idea was that the coefficients  $c_n$  in the formal power series

$$x^a = c_0^a + s c_1^a + s^2 c_2^a + \dots \quad (4)$$

could be computed using

$$c_n^a = \frac{1}{n!} \left. \frac{d^n x^a}{ds^n} \right|_{s=0} \quad (5)$$

with the second, third and higher derivatives of  $x^a$  found by successive differentiation of the geodesic equation. The generalised connections were introduced as part of this algorithm, leading to

$$c_n^a = - \Gamma_{\underline{c}_n}^a A^{\underline{c}_n} \Big|_{s=0} \quad n = 2, 3, 4 \dots \quad (6)$$

and

$$\Gamma_{\underline{c}_{n+1}}^a A^{\underline{c}_{n+1}} = \frac{d}{ds} (\Gamma_{\underline{c}_n}^a A^{\underline{c}_n}) \quad (7)$$

with  $d/ds = A^a \partial_a$ ,  $A^a = dx^a/ds$  and  $dA^a/ds = -\Gamma_{bc}^a A^b A^c$ .

The upshot is that computing the  $\Gamma_{\underline{c}_n}^a A^{\underline{c}_n}$  requires little more than successive rounds of differentiation (and a few substitutions for the derivatives of  $A^a$ ).

Note that the coefficients  $c_0$  and  $c_1$  must be determined from the initial conditions. Suppose that  $x^a = x_i^a$  at  $s = 0$  then  $c_0 = x_i^a$  while  $c_1 = A^a$ .

The Riemann normal coordinates of the point  $j$  (where  $s = 1$ ) are introduced by setting

$$y^a = A^a \quad (8)$$

This leads to

$$x_j^a = x_i^a + y^a - \sum_{k=2}^{\infty} \frac{1}{k!} \Gamma_{\underline{b}_k}^a y^{\underline{b}_k} \quad (9)$$

Note that given two points  $i$  and  $j$ , the  $y^a$  would be found as a root of this non-linear equation for  $y^a$ .

## Stage 2: The fixed point scheme for $y^a$

This second stage is almost exactly the same as the corresponding stage in `geodesic-bvp`. The difference here is that the generalised connections involve partial derivatives of the connection. In `contrat`, the `geodesic-bvp` code is specific to RNC and thus uses the generalised connections based on covariant derivatives of the Riemann tensor.

We begin this second stage by rewriting the equation (9) in the suggestive form

$$y^a = x_j^a - x_i^a + \sum_{k=2}^{\infty} \frac{1}{k!} \Gamma^a_{\underline{b}_k} y^{\underline{b}_k}$$

and then use this as the basis of a fixed point iteration scheme.

Start with the first approximation  $y_1^a = x_j^a - x_i^a = \Delta x^a$ , then compute the successive approximations

$$y_1^a = \Delta x^a$$

$$y_2^a = y_1^a + \frac{1}{2!} \Gamma^a_{bc} y_1^b y_1^c$$

$$y_3^a = y_1^a + \frac{1}{2!} \Gamma^a_{bc} y_2^b y_2^c + \frac{1}{3!} \Gamma^a_{bcd} y_1^b y_1^c y_1^d$$

$$y_4^a = y_1^a + \frac{1}{2!} \Gamma^a_{bc} y_3^b y_3^c + \frac{1}{3!} \Gamma^a_{bcd} y_2^b y_2^c y_2^d + \frac{1}{4!} \Gamma^a_{bcde} y_1^b y_1^c y_1^d y_1^e$$

$$y_5^a = y_1^a + \frac{1}{2!} \Gamma^a_{bc} y_4^b y_4^c + \frac{1}{3!} \Gamma^a_{bcd} y_3^b y_3^c y_3^d + \frac{1}{4!} \Gamma^a_{bcde} y_2^b y_2^c y_2^d y_2^e + \frac{1}{5!} \Gamma^a_{bcdef} y_1^b y_1^c y_1^d y_1^e y_1^f$$

and so on. Not that the  $\Gamma^a_{bc}$ ,  $\Gamma^a_{bcd}$ ,  $\Gamma^a_{bcde}$  etc. will all depend on the original coordinates  $x^a$  at the initial point (i.e.,  $P = x_i^a$ ).

## Stage3: Introduce the generalised connections from Stage 1

This is the final stage – it introduces the generalised connection after the completion of the fixed point scheme.

The result will be an equation for the  $y^a$  in terms of the original coordinates  $x^a$  and the connections (and its derivatives) at a chosen point  $s = 0$  (aka  $i$ ).

The  $y^a$  define an RNC frame in the neighbourhood of the chosen point  $i$ .

## Stage 1: The generalised connections
