

Symmetrised partial derivatives of the Riemann tensor

Here we compute the symmetrised partial derivatives $R^a_{(bcd;\underline{e})}$ in terms of the symmetrised covariant derivatives $R^a_{(bcd;\underline{e})}$. Note that the dot over an index indicates that that index does not take part in the symmetrisation.

We will use the algorithm described in section (10.3) of my lcb09-03 paper. Here we will make one small change of notation – the symbol D^a will be replaced with A^a .

We have lots of space (and no annoying editors to appease with brevity) so I will take the liberty to expand slightly on what I wrote in the lcb0-03 paper.

Our starting point is the simple identity

$$(R^a_{cdb} B^b_{a} A^c A^d)_{;e} A^e = (R^a_{cdb} B^b_{a} A^c A^d)_{;e} A^e \quad (1)$$

This is true in all frames since the quantity inside the brackets is a scalar. We are free to make any choice we like for A^a and B^a_b so let's choose A^a to be the tangent vector to any geodesic through the origin and choose the B^a_b to be constants (i.e, all partial derivatives are zero). We will also use local Riemann normal coordinates and as a consequence, the A^a will also be constant along the integral curves of A (the geodesics in an RNC are always of the form $x^a(s) = sA^a$ for some affine parameter s on the geodesic). Let df/ds be the directional derivative of the function f along the geodesics defined by A^a and assume that s is the proper length along the geodesic (although any affine parameter would be sufficient).

Thus at the origin we have, by choice,

$$\begin{aligned} 0 &= B^a_{b,c} = B^a_{b,cd} = B^a_{b,cde} = \dots \\ 0 &= dA^a/ds = d^2 A^a/ds^2 = d^3 A^a/ds^3 = \dots \\ 0 &= A^a_{;b} A^b = (A^a_{;b} A^b)_{;c} A^c = \left((A^a_{;b} A^b)_{;c} A^c \right)_{;d} A^d \\ 0 &= A^a_{;b} A^b = (A^a_{;b} A^b)_{;c} A^c = \left((A^a_{;b} A^b)_{;c} A^c \right)_{;d} A^d \\ df/ds &= f_{,a} A^a = f_{;a} A^a \\ d^2 f/ds^2 &= (f_{,a} A^a)_{;b} A^b = (f_{;a} A^a)_{;b} A^b \\ d^3 f/ds^3 &= \left((f_{,a} A^a)_{;b} A^b \right)_{;c} A^c = \left((f_{;a} A^a)_{;b} A^b \right)_{;c} A^c \end{aligned}$$

I admit I've gone overboard here in writing out more than I need to but it's handy to have all of these equations laid bare in one convenient place.

Now put $f = R^p_{abq} B^q_p A^a A^b$. Then upon taking successive derivatives, while taking full advantage of the assumptions just noted, we can easily see that

$$(R^a_{cdb} B^b_a)_{;e} A^c A^d A^e = (R^a_{cdb})_{;e} B^b_a A^c A^d A^e \quad (2)$$

This is the equation that will be computed by the following Cadabra code. All of the computations will be carried out on the left hand side (in the first version of the paper I swapped the left and right hand sides).

We will need the successive covariant derivatives of B . The first covariant derivative is just

$$B^a_{b;c} A^c = \Gamma^a_{dc} B^d_b A^c - \Gamma^d_{bc} B^a_d A^c$$

The quantities on the left hand side are the components of a tensor so further covariant derivatives of the right hand side can be computed (despite the presence of the Γ 's) by application of the usual rule for a covariant derivative of a mixed tensor.

Stage 1: Symmetrised partial derivatives of R

The first stage involves the expansion of the left side of (2). This leads to expressions for the symmetrized partial derivatives of R_{abcd} in terms of the symmetrized covariant derivatives of R_{abcd} and B^a_b .

$$\begin{aligned} (R^a_{cdb})_{;e} B^b_a A^c A^d A^e &= -A^a A^b A^c B^d_e \nabla_a R_{bfcd} g^{ef} - A^a A^b A^c R_{afbd} \nabla_c B^d_e g^{ef} \\ (R^a_{cdb})_{;ef} B^b_a A^c A^d A^e A^f &= -2A^a A^b A^c A^d \nabla_a B^e_f \nabla_b R_{cedg} g^{fg} - A^a A^b A^c A^d B^e_f \nabla_a (\nabla_b R_{cedg}) g^{fg} - A^a A^b A^c A^d R_{aebg} \nabla_c (\nabla_d B^e_f) g^{gf} \\ (R^a_{cdb})_{;efg} B^b_a A^c A^d A^e A^f A^g &= -3A^a A^b A^c A^d A^e \nabla_a R_{bfch} \nabla_d (\nabla_e B^f_g) g^{hg} - 3A^a A^b A^c A^d A^e \nabla_a B^f_g \nabla_b (\nabla_c R_{dfeh}) g^{gh} \\ &\quad - A^a A^b A^c A^d A^e B^f_g \nabla_a (\nabla_b (\nabla_c R_{dfeh})) g^{gh} - A^a A^b A^c A^d A^e R_{afbh} \nabla_c (\nabla_d (\nabla_e B^f_g)) g^{hg} \end{aligned}$$

Stage 2: Symmetrised covariant derivatives of B

In this stage the symmetrized covariant derivatives of B^a_b are computed in terms of its partial derivatives (which by choice are all zero) and the connection and its partial derivatives (which in general are not zero).

$$\begin{aligned}
A^c \nabla_c (B^a_b) &= \Gamma^a_{pq} B^p_b A^q - \Gamma^p_{bq} B^a_p A^q \\
A^d A^c \nabla_d (\nabla_c (B^a_b)) &= A^c \partial_c \Gamma^a_{pq} B^p_b A^q - A^c \partial_c \Gamma^p_{bq} B^a_p A^q + \Gamma^a_{cd} \Gamma^c_{pq} B^p_b A^d A^q - 2 \Gamma^a_{cd} \Gamma^p_{bq} B^c_p A^d A^q + \Gamma^c_{bd} \Gamma^p_{cq} B^a_p A^d A^q \\
A^e A^d A^c \nabla_e (\nabla_d (\nabla_c (B^a_b))) &= A^c A^e \partial_{ce} \Gamma^a_{pq} B^p_b A^q - A^c A^e \partial_{ce} \Gamma^p_{bq} B^a_p A^q + A^c \partial_c \Gamma^a_{de} \Gamma^d_{pq} B^p_b A^e A^q + A^c \Gamma^a_{cd} \partial_e \Gamma^d_{pq} B^p_b A^e A^q \\
&\quad - 2 A^c \partial_c \Gamma^a_{de} \Gamma^p_{bq} B^d_p A^e A^q - 2 A^c \Gamma^a_{cd} \partial_e \Gamma^p_{bq} B^d_p A^e A^q + A^c \partial_c \Gamma^d_{be} \Gamma^p_{dq} B^a_p A^e A^q + A^c \Gamma^d_{bc} \partial_e \Gamma^p_{dq} B^a_p A^e A^q \\
&\quad + \Gamma^a_{ce} A^c \partial_f \Gamma^e_{pq} B^p_b A^f A^q - \Gamma^a_{ce} A^c \partial_f \Gamma^p_{bq} B^e_p A^f A^q + \Gamma^a_{cd} \Gamma^e_{cf} \Gamma^e_{pq} B^p_b A^d A^f A^q - 3 \Gamma^a_{cd} \Gamma^e_{bf} \Gamma^c_{pq} B^p_e A^d A^f A^q \\
&\quad + 3 \Gamma^a_{cd} \Gamma^e_{bf} \Gamma^p_{eq} B^c_p A^d A^f A^q - \Gamma^c_{be} A^e \partial_f \Gamma^a_{pq} B^p_c A^f A^q + \Gamma^c_{be} A^e \partial_f \Gamma^p_{cq} B^a_p A^f A^q - \Gamma^c_{bd} \Gamma^e_{cf} \Gamma^p_{eq} B^a_p A^d A^f A^q
\end{aligned}$$

Stage 3: Impose the Riemann normal coordinate condition on covariant derivs of B

Here we impose the RNC condition (that $\Gamma = 0$ while $\partial\Gamma \neq 0$).

$$\begin{aligned}
A^c \nabla_c (B^a_b) &= 0 \\
A^d A^c \nabla_d (\nabla_c (B^a_b)) &= A^c \partial_c \Gamma^a_{pq} B^p_b A^q - A^c \partial_c \Gamma^p_{bq} B^a_p A^q \\
A^e A^d A^c \nabla_e (\nabla_d (\nabla_c (B^a_b))) &= A^c A^e \partial_{ce} \Gamma^a_{pq} B^p_b A^q - A^c A^e \partial_{ce} \Gamma^p_{bq} B^a_p A^q
\end{aligned}$$

Stage 4: Replace covariant derivs of B with partial derivs of Γ

This stage uses the results from the second stage to eliminate the ∇B terms from the results of the first stage. This produces expressions for the symmetrized partial derivatives of R_{abcd} in terms of the symmetrized covariant derivatives of R_{abcd} and the partial derivatives of the connection. In this stage we also set the B^a_b to equal 1.

$$\begin{aligned}
(R^a_{cdb})_{,e} A^c A^d A^e &= -A^c A^d A^e \nabla_c R_{dfeb} g^{af} \\
(R^a_{cdb})_{,ef} A^c A^d A^e A^f &= A^c A^d A^e A^f (-\nabla_{cd} R_{ebfg} g^{ag} - R_{cgdh} \partial_e \Gamma^g_{bf} g^{ha} + R_{cbdg} \partial_e \Gamma^a_{hf} g^{gh}) \\
(R^a_{cdb})_{,efg} A^c A^d A^e A^f A^g &= A^c A^d A^e A^f A^g (-3 \nabla_c R_{dhef} \partial_f \Gamma^h_{bg} g^{ia} + 3 \nabla_c R_{dbeh} \partial_f \Gamma^a_{ig} g^{hi} - \nabla_{cde} R_{fbgh} g^{ah} - R_{chdi} \partial_{ef} \Gamma^h_{bg} g^{ia} + R_{cbdh} \partial_{ef} \Gamma^a_{ig} g^{hi})
\end{aligned}$$

Stage 5: Replace partial derivs of Γ with partial derivs of R

The fifth stage draws in results from `dGamma.tex` to replace the partial derivatives of Γ with partial derivatives of R_{abcd} .

$$\begin{aligned}
(R^a_{\text{cdb}})_{,e} A^c A^d A^e &= -A^c A^d A^e \nabla_c R_{dfeb} g^{af} \\
(R^a_{\text{cdb}})_{,ef} A^c A^d A^e A^f &= -A^c A^d A^e A^f \nabla_{cd} R_{ebfg} g^{ag} - \frac{1}{3} A^c A^d A^e A^f R^g_{feb} R_{cgdh} g^{ha} + \frac{1}{3} A^c A^d A^e A^f R^a_{feg} R_{cbdh} g^{hg} \\
(R^a_{\text{cdb}})_{,efg} A^c A^d A^e A^f A^g &= -A^c A^d A^e A^f A^g R^h_{gfb} \nabla_c R_{dhei} g^{ia} + A^c A^d A^e A^f A^g R^a_{gfh} \nabla_c R_{dbei} g^{ih} - A^c A^d A^e A^f A^g \nabla_{cde} R_{fbgh} g^{ah} \\
&\quad - \frac{1}{2} A^c A^d A^e A^f A^g R_{chdi} \partial_f R^h_{geb} g^{ia} + \frac{1}{2} A^c A^d A^e A^f A^g R_{cbdh} \partial_f R^a_{gei} g^{hi}
\end{aligned}$$

Stage 6: Replace partial derivs of R with covariant derivs of R

The final stage is to eliminate the ∂R by using earlier results. For example, in the equation for $\partial^3 R$ we see terms involving ∂R . These first order partial derivatives can be replaced with the expression previously computed for ∂R in terms of ∇R .

$$\begin{aligned}
(R^a_{\text{cdb}})_{,e} A^c A^d A^e &= A^c A^d A^e \nabla_c R_{bdef} g^{af} \\
(R^a_{\text{cdb}})_{,ef} A^c A^d A^e A^f &= A^c A^d A^e A^f \nabla_{cd} R_{befg} g^{ag} \\
(R^a_{\text{cdb}})_{,efg} A^c A^d A^e A^f A^g &= -\frac{1}{2} A^c A^d A^e A^f A^g R_{bcdh} \nabla_e R_{figj} g^{ai} g^{hj} + \frac{1}{2} A^c A^d A^e A^f A^g R_{chdi} \nabla_e R_{bfgj} g^{ah} g^{ij} + A^c A^d A^e A^f A^g \nabla_{cde} R_{bfgh} g^{ah}
\end{aligned}$$

The end result are expressions for the symmetrized partial derivatives of R_{abcd} solely in terms of the symmetrized covariant derivatives of R_{abcd} .

# no longer need B, so let's get rid of it

# two subtle tricks are used here
# 1) rename A and B as A002 and A001 before sort_product,
#    this ensures B will be to left of A after the sort
# 2) indices on B changed from  $B^{\{a\}_{\{b\}}$  to  $B_{\{b\}}^{\{a\}}$ ,
#    this ensures that after factor_out B will have dummy indices  $B_{\{a\}}^{\{b\}}$

Stage 6: Replace partial derivs of R with covariant derivs of R

```
# now eliminate remaining partial derivs of Rabcd by substitution from the lower order dRabcd

# note that
#   dRabcd01 = R^a_{cdb,e} A^c A^d A^e
#   dRabcd02 = R^a_{cdb,ef} A^c A^d A^e A^f
#   dRabcd03 = R^a_{cdb,efg} A^c A^d A^e A^f A^g

# thus we can use
#   dRabcd01 to eliminate 1st partial derivs of R in dRabcd03, dRabcd04, etc.
#   dRabcd02 to eliminate 2nd partial derivs of R in dRabcd04, dRabcd05, etc.
#   dRabcd03 to eliminate 3rd partial derivs of R in dRabcd05, dRabcd06, etc.
