The metric tensor in Riemann normal coordinates

In this notebook we compute the recursive sequences

$$g_{ab,d\underline{e}} = \left(g_{cb}\Gamma^{c}{}_{a(d}\right)_{,\underline{e})} + \left(g_{ac}\Gamma^{c}{}_{b(d}\right)_{,\underline{e})} \tag{1}$$

$$(n+3)\Gamma^{a}{}_{d(b,c\underline{e})} = (n+1)\left(R^{a}{}_{(bcd,\underline{e})} - \left(\Gamma^{a}{}_{f(c}\Gamma^{f}{}_{bd}\right)_{,\underline{e})}\right) \tag{2}$$

for $n = 1, 2, 3, \cdots$. Note in these equations that the (extended) index $\underline{e}$ contains n normal indices.

We then construct a Taylor series for the metric using

$$\begin{aligned} g_{ab}(x) &= g_{ab} + g_{ab,c}x^{c} + \frac{1}{2!}g_{ab,cd}x^{c}x^{d} + \frac{1}{3!}g_{ab,cde}x^{c}x^{d}x^{e} + \cdots \\ &= g_{ab} + \sum_{n=1}^{\infty} \frac{1}{n!}\, g_{ab,\underline{c}}\, x^{\cdot\underline{c}} \end{aligned}$$

Stage 1: Symmetrised partial derivatives of g_{ab}

In this stage, equation (1) is used to express the symmetrised partial derivatives of the metric in terms of the symmetrised partial derivatives of the connection.

$$\begin{aligned} g_{ab,c}A^{c} &= 0 \\ g_{ab,cd}A^{c}A^{d} &= g_{cb}\partial_{e}\Gamma^{c}{}_{ad}A^{d}A^{e} + g_{ac}\partial_{e}\Gamma^{c}{}_{bd}A^{d}A^{e} \\ g_{ab,cde}A^{c}A^{d}A^{e} &= g_{cb}\partial_{fe}\Gamma^{c}{}_{ad}A^{d}A^{e}A^{f} + g_{ac}\partial_{fe}\Gamma^{c}{}_{bd}A^{d}A^{e}A^{f} \end{aligned}$$

Stage 2: Replace derivatives of Γ with partial derivs of R

Now we use the results from `dGamma` to replace derivatives of Γ with partial derivatives of R. These were computed in `dGamma` using equation (2) above.

$$g_{ab,c}A^c = 0$$

$$g_{ab,cd}A^cA^d = \frac{1}{3}\,g_{cb}A^dA^eR^c{}_{dea} + \frac{1}{3}\,g_{ac}A^dA^eR^c{}_{deb}$$

$$g_{ab,cde}A^cA^dA^e = \frac{1}{2}\,g_{cb}A^eA^dA^f\partial_e R^c{}_{dfa} + \frac{1}{2}\,g_{ac}A^eA^dA^f\partial_e R^c{}_{dfb}$$

Stage 3: Replace partial derivs of R with covariant derivs of R

Next we use the results from `dRabcd` to replace the partial derivatives of R with covariant deriavtives.

$$g_{ab,c}A^c = 0$$

$$g_{ab,cd}A^cA^d = -\frac{2}{3}\,A^cA^dR_{acbd}$$

$$g_{ab,cde}A^cA^dA^e = \frac{1}{2}\,g_{cb}A^dA^fA^e\nabla_d R_{afeg}g^{cg} + \frac{1}{2}\,g_{ac}A^dA^fA^e\nabla_d R_{bfeg}g^{cg}$$

Stage 4: Build the Taylor series for g_{ab}, reformatting and output

Each of the above expressions constitutues one term in the Taylor series for the metric. We also make the trivial change $A \to x$. Then we do some trivial reformatting.

$$\begin{aligned} g_{ab}(x) &= g_{ab} + g_{ab,c}x^c + \frac{1}{2!}g_{ab,cd}x^cx^d + \frac{1}{3!}g_{ab,cde}x^cx^dx^e + \mathcal{O}\left(\epsilon^4\right) \\ &= g_{ab} - \frac{1}{3}\,x^cx^dR_{acbd} - \frac{1}{6}\,x^cx^dx^e\nabla_c R_{adbe} + \mathcal{O}\left(\epsilon^4\right) \end{aligned}$$

The inverse metric tensor in Riemann normal coordinates

Here we calculate the Riemann normal expansion of the inverse metric, g^{ab}, by developing the recursive sequences

$$g^{ab}{}_{,d\underline{e}} = -\left(g^{cb}\Gamma^{a}{}_{c(d}\right)_{,\underline{e})} - \left(g^{ac}\Gamma^{b}{}_{c(d}\right)_{,\underline{e})} \tag{1}$$

$$(n+3)\Gamma^{a}{}_{d(b,c\underline{e})} = (n+1)\left(R^{a}{}_{(bcd,\underline{e})} - \left(\Gamma^{a}{}_{f(c}\Gamma^{f}{}_{bd}\right)_{,\underline{e})}\right) \tag{2}$$

for $n = 1, 2, 3, \cdots$. Note in these equations that the (extended) index $\underline{e}$ contains n normal indices.

We then construct a Taylor series for the metric using

$$\begin{aligned} g^{ab}(x) &= g^{ab} + g^{ab}{}_{,c}x^{c} + \frac{1}{2!}g^{ab}{}_{,cd}x^{c}x^{d} + \frac{1}{3!}g^{ab}{}_{,cde}x^{c}x^{d}x^{e} + \cdots \\ &= g^{ab} + \sum_{n=1}^{\infty}\frac{1}{n!}\,g^{ab}{}_{,\underline{c}}\,x^{\underline{c}} \end{aligned}$$

Stage 1: Symmetrised partial derivatives of g^{ab}

In this stage, equation (1) is used to express the symmetrised partial derivatives of the metric in terms of the symmetrised partial derivatives of the connection.

$$\begin{aligned} g^{ab}{}_{,c}A^{c} &= 0 \\ g^{ab}{}_{,cd}A^{c}A^{d} &= -\,g^{cb}\partial_{e}\Gamma^{a}{}_{cd}A^{d}A^{e} - \,g^{ac}\partial_{e}\Gamma^{b}{}_{cd}A^{d}A^{e} \\ g^{ab}{}_{,cde}A^{c}A^{d}A^{e} &= -\,g^{cb}\partial_{fe}\Gamma^{a}{}_{cd}A^{d}A^{e}A^{f} - \,g^{ac}\partial_{fe}\Gamma^{b}{}_{cd}A^{d}A^{e}A^{f} \end{aligned}$$

Stage 2: Replace derivatives of Γ with partial derivs of R

Now we use the results from `dGamma` to replace derivatives of Γ with partial derivatives of R. These were computed in `dGamma` using equation (2) above.

$$g^{ab}{}_{,c}A^c = 0$$

$$g^{ab}{}_{,cd}A^cA^d = -\frac{1}{3}\,g^{cb}A^dA^eR^a{}_{dec} - \frac{1}{3}\,g^{ac}A^dA^eR^b{}_{dec}$$

$$g^{ab}{}_{,cde}A^cA^dA^e = -\frac{1}{2}\,g^{cb}A^eA^dA^f\partial_eR^a{}_{dfc} - \frac{1}{2}\,g^{ac}A^eA^dA^f\partial_eR^b{}_{dfc}$$

Stage 3: Replace partial derivs of R with covariant derivs of R

Next we use the results from `dRabcd` to replace the partial derivatives of R with covariant deriavtives.

$$g^{ab}{}_{,c}A^c = 0$$

$$g^{ab}{}_{,cd}A^cA^d = -\frac{1}{3}\,A^cA^dR^a{}_{cd}{}^b - \frac{1}{3}\,A^cA^dR^b{}_{cd}{}^a$$

$$g^{ab}{}_{,cde}A^cA^dA^e = -\frac{1}{2}\,g^{cb}A^dA^fA^e\nabla_dR_{cfeg}g^{ag} - \frac{1}{2}\,g^{ac}A^dA^fA^e\nabla_dR_{cfeg}g^{bg}$$

Stage 4: Build the Taylor series for g_{ab}, reformatting and output

Each of the above expressions constitutues one term in the Taylor series for the metric. We also make the trivial change $A \to x$. Then we do some trivial reformatting.

$$\begin{aligned} g_{ab}(x) &= g^{ab} + g^{ab}{}_{,c}x^c + \frac{1}{2!}g^{ab}{}_{,cd}x^cx^d + \frac{1}{3!}g^{ab}{}_{,cde}x^cx^dx^e + \mathcal{O}\left(\epsilon^4\right) \\ &= g^{ab} + \frac{1}{3}\,x^cx^dR_{cedf}g^{ae}g^{bf} + \frac{1}{6}\,x^cx^dx^e\nabla_cR_{dfeg}g^{af}g^{bg} + \mathcal{O}\left(\epsilon^4\right) \end{aligned}$$

The connection

Here we use the output from `metric.tex` and `metric-inv.tex` to compute the metric connection Γ^{d}_{ab}. We use the standard metric compatible connection

$$\Gamma^{d}_{ab} = \frac{1}{2} g^{dc} \left(g_{cb,a} + g_{ac,b} - g_{ab,c} \right) \tag{1}$$

Since `metric.tex` and `metric-inv.tex` generate truncated expressions for g_{ab} and g^{ab} a similar truncation must be applied to this computation of Γ^{d}_{ab}. The naive choice is to truncate Γ^{d}_{ab} *after* it has been fully evaluated on the truncated expersions for g_{ab} and g^{ab}. This will work but it wastes time and memory (big time).

A better approach is to truncate Γ^{d}_{ab} during its construction. That is, we take careful note of how the terms in the finite series for g_{ab} and g^{ab} combine to produce the terms of a particular order in the expansion of Γ^{d}_{ab}.

Suppose g_{ab} and g^{ab} are known to say fourth order. We can write each of these as follows

$$g_{ab} = \overset{0}{g}_{ab} + \overset{1}{g}_{ab} + \overset{2}{g}_{ab} + \overset{3}{g}_{ab} + \overset{4}{g}_{ab} \tag{2}$$

$$g^{ab} = \overset{0}{g}{}^{ab} + \overset{1}{g}{}^{ab} + \overset{2}{g}{}^{ab} + \overset{3}{g}{}^{ab} + \overset{4}{g}{}^{ab} \tag{3}$$

where $\overset{n}{g}$ denotes a term of order $\mathcal{O}\left(\epsilon^{n}\right)$. A similar expansion applies for Γ^{d}_{ab}, that is

$$\Gamma^{d}_{ab} = \overset{0}{\Gamma}{}^{d}_{ab} + \overset{1}{\Gamma}{}^{d}_{ab} + \overset{2}{\Gamma}{}^{d}_{ab} + \overset{3}{\Gamma}{}^{d}_{ab} + \overset{4}{\Gamma}{}^{d}_{ab} \tag{4}$$

After substituting these formal expansions into the equation (1) and then matching corresponing terms we obtain

$$\overset{n}{\Gamma}{}^{d}_{ab} = \frac{1}{2} \sum_{i=0}^{i=n} \overset{i}{g}{}^{dc} \left(\overset{n-i}{g}{}_{cb,a} + \overset{n-i}{g}{}_{ac,b} - \overset{n-i}{g}{}_{ab,c} \right) \tag{5}$$

We use this equation to compute the successive terms in Γ^{d}_{ab}.

# Note:
# Computing Gamma directly by (1/2) iab dgab and *then* truncating to lower order
# is not optimal. We only want the leading oder terms (to 4th order in x). But the direct
# calculation would compute *all* terms before the truncation. This does work but it
# is slower than the following code.
#
# The better approach (as adopted in this code) is to extract all of the terms of iab
# and dgab then construct the leading order terms of Gamma (to fifth order) term by term.

def get_Rterm (obj,n):

# I would like to assign different weights to \nabla_{a}, \nabla_{a b}, \nabla_{a b c} etc. but no matter
# what I do it appears that Cadabra assigns the same weight to all of these regardless of the number of subscripts.
# It seems that the weight is assigned to the symbol \nabla alone. So I'm forced to use the following substitution trick.

    Q_{a b c d}::Weight(label=numR,value=2).
    Q_{a b c d e}::Weight(label=numR,value=3).
    Q_{a b c d e f}::Weight(label=numR,value=4).
    Q_{a b c d e f g}::Weight(label=numR,value=5).

    tmp := @(obj).

# Convert free indices on iab from ^{a b} to ^{d c}
# This ensures we can later build products like @(iab) @(dgab) knowing that the indices are correctly ordered.
# Without this step we would be using free indices ^{a b} and _{a b c}. Thus the product @(iab) @(dgab) would
# have just one free index _{c}. This is clearly wrong.

\end{aligned}$$

The generalised connections

The generalised connections may be computed recursively using

$$\Gamma^{a}{}_{b\underline{c}d} = \Gamma^{a}{}_{(b\underline{c},d)} - (n+1)\Gamma^{a}{}_{p(\underline{c}}\Gamma^{p}{}_{bd)} \tag{1}$$

where $\underline{c}$ contains $n > 0$ indices. The sequence begins with the standard metric compatible connection

$$\Gamma^{d}_{ab} = \frac{1}{2} g^{dc} \left(g_{cb,a} + g_{ac,b} - g_{ab,c}\right) \tag{2}$$

Here we will use the results of `metric.tex` and `metric-inv.tex` to compute the metric connection Γ^{d}_{ab}. But since the g_{ab} and g^{ab} provided by those codes are truncated at a particular order in the curvatures (and thus are only approximations to the g_{ab} and g^{ab}) similar truncations will arise in the $\Gamma^{a}{}_{b\underline{c}d}$.

Approximations will be denoted by the addition of an overbar to an object. In this notation the metric g can be written as

$$g = \bar{g} + \mathcal{O}\left(\epsilon^{n}\right) \tag{3}$$

in which $\bar{g}$ is the truncated polynomial approximation to g and $\mathcal{O}\left(\epsilon^{n}\right)$ is the error term (containing terms no smaller than ϵ^{n}). The polynomial structure of $\bar{g}$ can be expressed as

$$\bar{g} = \overset{0}{\bar{g}} + \overset{1}{\bar{g}} + \overset{2}{\bar{g}} + \cdots + \overset{p}{\bar{g}} \tag{4}$$

in which each terms like $\overset{m}{\bar{g}}$ contains only terms of order m. This notation will be applied to other quantities in particular the generalised connections.

The notation $\mathcal{O}\left(\epsilon^{n}\right)$ denotes terms in the curvatures that are of order ϵ^{n}. What does this actually mean? Each term in R is of order ϵ^{2} while each derivative of R carries an extra power of ϵ. Thus $R \cdot R = \mathcal{O}\left(\epsilon^{4}\right)$, $R \cdot R \cdot \nabla R = \mathcal{O}\left(\epsilon^{7}\right)$ and $R \cdot R \cdot \nabla^{2} R = \mathcal{O}\left(\epsilon^{8}\right)$.

We will also adopt the convention that an object is said to be an $\mathcal{O}\left(\epsilon^{m}\right)$ approximation when the corresponding error term is $\mathcal{O}\left(\epsilon^{m+1}\right)$.

Consider the $\mathcal{O}\left(\epsilon^{m}\right)$ approximation of the generalised connection, namely,

$$\bar{\Gamma}^{a}{}_{b\underline{c}_n d} = \overset{0}{\bar{\Gamma}}{}^{a}{}_{b\underline{c}_n d} + \overset{1}{\bar{\Gamma}}{}^{a}{}_{b\underline{c}_n d} + \overset{2}{\bar{\Gamma}}{}^{a}{}_{b\underline{c}_n d} + \cdots + \overset{m}{\bar{\Gamma}}{}^{a}{}_{b\underline{c}_n d} \tag{5}$$

where $\underline{c}_n$ denotes a set of indices such as $c_1 c_2 c_3 \ldots c_n$.

The first thing to note is that

$$0 = \overset{1+n}{\bar{\Gamma}}{}^{a}{}_{(b\underline{c}_n,d)} \tag{6}$$

There are two proofs of this claim. For the first proof, note (by inspection) that the order $\mathcal{O}\left(\epsilon^p\right)$ approximation for $\bar{\Gamma}^a{}_{b\underline{c}_n d}$ is a polynomial in x of degree $p-n-1$. Thus $\overset{1+n}{\bar{\Gamma}}{}^a{}_{(b\underline{c}_n,d)}$ is a polynomial in x of degree zero, i.e., a constant. However, we know that all generalised connections vanish at the origin of the RNC frame. Thus this constant must be zero. The second proof makes explicit use of the first (and second?) Bianchi identity, that is $0 = R_{a(bcd)}$. The term $\overset{1+n}{\bar{\Gamma}}{}^a{}_{(b\underline{c}_n,d)}$ will itself consist of a sum of terms built from combinations of x, R, ∇R etc. The x^a will always appear in a contraction with one of the indices on R_{abcd} or one of its derivatives. Consider any one of these terms, denoted by A, and assume for the moment that $1+n$ is an even number, say $1+n=2p$. The indices $(b\underline{c}_n, d)$ must somehow be assigned to the factors that comprise A. Our aim is to show that at least one R factor in A will receive 3 of these indices and thus by the Bianchi identities will be zero. If there are too many R factors then the Bianchi identities will not come into play. So how many R factors can we expect? Since A is a term in an $\mathcal{O}\left(\epsilon^{(n+1)}\right)$ approximation there can be no more than $(n+1)/2 = p$ Riemann factors. There will be at least one x term contracted with one of the p Riemann factors. However, we have $n+2 = 2p+1$ indices to distribute amongst the x term and p Riemann factors. One of the indices is a derivative index and will have nett effect of transferring that index from x to one of the Riemann factors. The remaining $2p$ indices must be distributed amongst the p Riemann factors. It is not possible to avoid assigning three indices to at least one of the Riemann factors. Thus, by the Bianchi identity, this A term must vanish. Similar arguments can be applied to the other cases where the A terms consists of products of R and its derivatives and in the case where $n+1$ is an odd number. The analysis always comes down to the distribution of the indices $(b\underline{c}_n, d)$ amongst the factors of a typical A term. In all cases the Bianchi identity will enter the play and force A to be zero.

A corollary of the second proof is that for all $m < n+2$

$$0 = \overset{m}{\bar{\Gamma}}{}^a{}_{b\underline{c}_n d} \tag{7}$$

The proof follows exactly that of the second proof given above.

We can use the above results to streamline the computation of the generalised connections. We begin with the formal expression for the $\mathcal{O}\left(\epsilon^m\right)$ approximations

$$\Gamma^a{}_{bc} = \overset{2}{\bar{\Gamma}}{}^a{}_{bc} + \overset{3}{\bar{\Gamma}}{}^a{}_{bc} + \overset{4}{\bar{\Gamma}}{}^a{}_{bc} + \cdots + \overset{m}{\bar{\Gamma}}{}^a{}_{bc} \tag{8}$$

$$\Gamma^a{}_{b\underline{c}} = \overset{n+1}{\bar{\Gamma}}{}^a{}_{b\underline{c}} + \overset{n+2}{\bar{\Gamma}}{}^a{}_{b\underline{c}} + \overset{n+3}{\bar{\Gamma}}{}^a{}_{b\underline{c}} + \cdots + \overset{m}{\bar{\Gamma}}{}^a{}_{b\underline{c}} \tag{9}$$

$$\Gamma^a{}_{b\underline{c}d} = \overset{n+2}{\bar{\Gamma}}{}^a{}_{b\underline{c}d} + \overset{n+3}{\bar{\Gamma}}{}^a{}_{b\underline{c}d} + \overset{n+4}{\bar{\Gamma}}{}^a{}_{b\underline{c}d} + \cdots + \overset{m}{\bar{\Gamma}}{}^a{}_{b\underline{c}d} \tag{10}$$

These can be substituted into equation (1) with the result

$$\Gamma^a{}_{b\underline{c}d} = \overset{n+1}{\bar{\Gamma}}{}^a{}_{(b\underline{c},d)} + \overset{n+2}{\bar{\Gamma}}{}^a{}_{(b\underline{c},d)} + \overset{n+3}{\bar{\Gamma}}{}^a{}_{(b\underline{c},d)} + \cdots + \overset{m}{\bar{\Gamma}}{}^a{}_{(b\underline{c},d)} - (n+1)\left(\overset{n+1}{\bar{\Gamma}}{}^a{}_{p\underline{c}} + \overset{n+2}{\bar{\Gamma}}{}^a{}_{p\underline{c}} + \overset{n+3}{\bar{\Gamma}}{}^a{}_{p\underline{c}} + \cdots + \overset{m}{\bar{\Gamma}}{}^a{}_{p\underline{c}}\right)\left(\overset{2}{\bar{\Gamma}}{}^p{}_{bd} + \overset{3}{\bar{\Gamma}}{}^p{}_{bd} + \overset{4}{\bar{\Gamma}}{}^p{}_{bd} + \cdots + \overset{m}{\bar{\Gamma}}{}^p{}_{bd}\right) \tag{11}$$

where it is understood that in expanding the pair of bracketed terms in the last result the terms should be symmetrised over $b\underline{c}d$ and also truncated to terms of order $\mathcal{O}\left(\epsilon^m\right)$. Note that the first term on the right hand side of this equation vanishes by way of the results described above.

Comparing the order m terms in equation (10) and (11) leads to the following equation

$$\overset{m}{\bar{\Gamma}}{}^a{}_{b\underline{c}d} = \overset{m}{\bar{\Gamma}}{}^a{}_{(b\underline{c},d)} - (n+1)\left(\overset{m-2}{\bar{\Gamma}}{}^a{}_{p(\underline{c}}\overset{2}{\bar{\Gamma}}{}^p{}_{bd)} + \overset{m-3}{\bar{\Gamma}}{}^a{}_{p(\underline{c}}\overset{3}{\bar{\Gamma}}{}^p{}_{bd)} + \overset{m-4}{\bar{\Gamma}}{}^a{}_{p(\underline{c}}\overset{4}{\bar{\Gamma}}{}^p{}_{bd)} + \cdots + \overset{n+1}{\bar{\Gamma}}{}^a{}_{p(\underline{c}}\overset{m-n-1}{\bar{\Gamma}}{}^p{}_{bd)} \right) \tag{12}$$

This one equation is all that is needed to compute all of the $\overset{p}{\bar{\Gamma}}{}^a{}_{b\underline{c}d}$ for $p = 3, 4, 5, \ldots m$ given just the $\overset{p}{\bar{\Gamma}}{}^a{}_{bd}$ for $p = 2, 3, 4, \ldots m$. For example, suppose $m = 5$ and suppose that we are given $\overset{p}{\bar{\Gamma}}{}^a{}_{bd}$ for $p = 2, 3, 4, 5$. Then with $n = 1$ we can use equation (12) to compute in turn, $\overset{p}{\bar{\Gamma}}{}^a{}_{bc_1d}$ for $p = 3, 4, 5$. Then with $n = 2$ we compute $\overset{p}{\bar{\Gamma}}{}^a{}_{bc_1c_2d}$ for $p = 4, 5$ and finally with $n = 3$ we compute $\overset{p}{\bar{\Gamma}}{}^a{}_{bc_1c_2c_3d}$ for $p = 5$. There are no terms like $\overset{p}{\bar{\Gamma}}{}^a{}_{bc_1c_2c_3c_4d}$ for $p \leq 5$ due to the corollary given earlier.

The explicit computations for $m = 5$ are as follows.

For $n = 1$,

$$\overset{3}{\bar{\Gamma}}{}^{a}{}_{bc_1d} = \overset{3}{\bar{\Gamma}}{}^{a}{}_{(bc_1,d)} \tag{13}$$

$$\overset{4}{\bar{\Gamma}}{}^{a}{}_{bc_1d} = \overset{4}{\bar{\Gamma}}{}^{a}{}_{(bc_1,d)} - 2\overset{2}{\bar{\Gamma}}{}^{a}{}_{p(c_1}\overset{2}{\bar{\Gamma}}{}^{p}{}_{bd)} \tag{14}$$

$$\overset{5}{\bar{\Gamma}}{}^{a}{}_{bc_1d} = \overset{5}{\bar{\Gamma}}{}^{a}{}_{(bc_1,d)} - 2\overset{3}{\bar{\Gamma}}{}^{a}{}_{p(c_1}\overset{2}{\bar{\Gamma}}{}^{p}{}_{bd)} - 2\overset{2}{\bar{\Gamma}}{}^{a}{}_{p(c_1}\overset{3}{\bar{\Gamma}}{}^{p}{}_{bd)} \tag{15}$$

For $n = 2$,

$$\overset{4}{\bar{\Gamma}}{}^{a}{}_{bc_1c_2d} = \overset{4}{\bar{\Gamma}}{}^{a}{}_{(bc_1c_2,d)} \tag{16}$$

$$\overset{5}{\bar{\Gamma}}{}^{a}{}_{bc_1c_2d} = \overset{5}{\bar{\Gamma}}{}^{a}{}_{(bc_1c_2,d)} - 3\overset{2}{\bar{\Gamma}}{}^{a}{}_{p(c_1c_2}\overset{2}{\bar{\Gamma}}{}^{p}{}_{bd)} \tag{17}$$

For $n = 3$,

$$\overset{5}{\bar{\Gamma}}{}^{a}{}_{bc_1c_2c_3d} = \overset{5}{\bar{\Gamma}}{}^{a}{}_{(bc_1c_2c_3,d)} \tag{18}$$

Symmetrized partial derivatives of the connection

Here we calculate the recursive sequences

$$(n+3)\Gamma^a{}_{d(b,c\underline{e}_n)} = (n+1)\left(R^a{}_{(bcd,\underline{e}_n)} - \left(\Gamma^a{}_{f(c}\Gamma^f{}_{bd)}\right)_{,\underline{e}_n)}\right)$$

for $n = 1, 2, 3, \cdots$. Note that the (extended) index $\underline{e}_n$ contains n normal indices.

The result will be expressions for the $\Gamma^a{}_{d(b,c\underline{e}_n)}$ in terms of the Riemann tensor and its partial derivatives.

Stage 1: Compute symmetrised derivatives

In the first stage we simply apply the above recursive equation using a simple trick to impose the symmetries. Start with the original equation and dot out the symmetric indices with A^a then factor out the partial derivatives. This leads to

$$(n+3)\Gamma^a{}_{db,c\underline{e}_n} A^b A^c A^{\cdot\underline{e}_n} = (n+1)\left(R^a{}_{bcd} - \Gamma^a{}_{fc}\Gamma^f{}_{bd}\right)_{,\underline{e}_n} A^b A^c A^{\cdot\underline{e}_n} \tag{1}$$

Thus we also have (for the next iteration)

$$(n+4)\Gamma^a{}_{db,c\underline{e}_{n+1}} A^b A^c A^{\cdot\underline{e}_{n+1}} = (n+2)\left(R^a{}_{bcd} - \Gamma^a{}_{fc}\Gamma^f{}_{bd}\right)_{,\underline{e}_{n+1}} A^b A^c A^{\cdot\underline{e}_{n+1}} \tag{2}$$

The A^a can be freely chosen so choose A^a to be a constant (i.e., zero derivative). Now define P_n by

$$P_n = \Gamma^a{}_{db,c\underline{e}_n} A^b A^c A^{\cdot\underline{e}_n} \tag{3}$$

then the above pair of equations can be combinded to give

$$P_{n+1} = \frac{(n+2)(n+3)}{(n+4)(n+1)} A^f \partial_f (P_n) \tag{4}$$

This is a very easy equation to compute as it just requires successive rounds of differentiation.

The first term in the sequence is P_0 given by

$$P_0 = \frac{1}{3} A^b A^c \left(R^a_{bcd} - \Gamma^a_{ce}\Gamma^e_{bd}\right) \tag{5}$$

The first few results are

$$
\begin{aligned}
P_0 &= A^b A^c \Gamma^a{}_{d(b,c)} = \frac{1}{3}\, A^b A^c \left(R^a_{\ bcd} - \Gamma^a{}_{ce}\Gamma^e{}_{bd}\right)\\
P_1 &= A^b A^c A^e \Gamma^a{}_{d(b,ce)} = \frac{1}{2}\, A^f A^b A^c \partial_f R^a_{\ bcd} - \frac{1}{2}\, A^f A^b A^c \partial_f \Gamma^a{}_{ce}\Gamma^e{}_{bd} - \frac{1}{2}\, A^f A^b A^c \Gamma^a{}_{ce}\partial_f \Gamma^e{}_{bd}\\
P_2 &= A^b A^c A^e A^f \Gamma^a{}_{d(b,cef)} = \frac{3}{5}\, A^g A^f A^b A^c \partial_{gf} R^a_{\ bcd} - \frac{3}{5}\, A^g A^f A^b A^c \partial_{gf}\Gamma^a{}_{ce}\Gamma^e{}_{bd} - \frac{3}{5}\, A^g A^f A^b A^c \partial_f \Gamma^a{}_{ce}\partial_g \Gamma^e{}_{bd}\\
&\quad - \frac{3}{5}\, A^g A^f A^b A^c \partial_g \Gamma^a{}_{ce}\partial_f \Gamma^e{}_{bd} - \frac{3}{5}\, A^g A^f A^b A^c \Gamma^a{}_{ce}\partial_{gf}\Gamma^e{}_{bd}
\end{aligned}
$$

Stage 2: Impose Riemann normal coordinates

Here we impose the RNC condition by setting the $\Gamma^a{}_{bc}$ to zero (but not their derivatives).

$$
\begin{aligned}
A^b A^c \Gamma^a{}_{d(b,c)} &= \frac{1}{3}\, A^b A^c R^a_{\ bcd}\\
A^b A^c A^e \Gamma^a{}_{d(b,ce)} &= \frac{1}{2}\, A^f A^b A^c \partial_f R^a_{\ bcd}\\
A^b A^c A^e A^f \Gamma^a{}_{d(b,cef)} &= \frac{3}{5}\, A^g A^f A^b A^c \partial_{gf} R^a_{\ bcd} - \frac{3}{5}\, A^g A^f A^b A^c \partial_f \Gamma^a{}_{ce}\partial_g \Gamma^e{}_{bd} - \frac{3}{5}\, A^g A^f A^b A^c \partial_g \Gamma^a{}_{ce}\partial_f \Gamma^e{}_{bd}
\end{aligned}
$$

Stage 3: Replace partial derivatives of Γ with partial derivatives of R

The key point to note is that the partial derivatives of Γ on the right hand side are all symmetrized in exactly the same manner as the partial derivatives on the left hand side. Thus results from the lower order equations can be fed into the later equations to completely eliminate the partial derivatives of Γ.

$$
\begin{aligned}
A^b A^c \Gamma^a{}_{d(b,c)} &= \frac{1}{3}\, A^b A^c R^a_{\ bcd}\\
A^b A^c A^e \Gamma^a{}_{d(b,ce)} &= \frac{1}{2}\, A^f A^b A^c \partial_f R^a_{\ bcd}\\
A^b A^c A^e A^f \Gamma^a{}_{d(b,cef)} &= \frac{3}{5}\, A^b A^c A^e A^f \partial_{fe} R^a_{\ bcd} - \frac{1}{15}\, A^b A^c A^e A^f R^a{}_{ceg} R^g{}_{bfd} - \frac{1}{15}\, A^b A^c A^e A^f R^a{}_{cfg} R^g{}_{bed}
\end{aligned}
$$

Stage 4: Reformatting

This is just simple reformatting.

$$
\begin{aligned}
3A^bA^c\Gamma^a{}_{d(b,c)} &= A^bA^cR^a{}_{bcd}\\
6A^bA^cA^e\Gamma^a{}_{d(b,ce)} &= 3\,A^bA^cA^e\partial_e R^a{}_{bcd}\\
15A^bA^cA^eA^f\Gamma^a{}_{d(b,cef)} &= A^bA^cA^eA^f\left(9\,\partial_{fe}R^a{}_{bcd} - R^a{}_{ceg}R^g{}_{bfd} - R^a{}_{cfg}R^g{}_{bed}\right)
\end{aligned}
$$

Stage 1: Compute symmetrised derivatives

Symmetrised partial derivatives of the Riemann tensor

Here we compute the symmetrised partial derivatoves $R^a{}_{(b\dot{c}d,\underline{e})}$ in terms of the symmetrised covariant derivatives $R^a{}_{(b\dot{c}d;\underline{e})}$. Note that the dot over an index indicates that that index does not take part in the symmetrisation.

We will use the algorithm described in section (10.3) of my lcb09-03 paper. Here we will make one small change of notation – the symbol D^a will replaced with A^a.

We have lots of space (and no annoying editors to appease with brevity) so I will take the liberty to expand slightly on what I wrote in the lcb0-03 paper.

Our starting point is the simple identity

$$\left(R^a{}_{cdb}B^b{}_a A^c A^d\right)_{;e} A^e = \left(R^a{}_{cdb}B^b{}_a A^c A^d\right)_{,e} A^e \tag{1}$$

This is true in all frames since the quantity inside the brackets is a scalar. We are free to make any choice we like for A^a and $B^a{}_b$ so let's choose A^a to be the tangent vector to any geodesic through the origin and choose the $B^a{}_b$ to be constants (i.e, all partial derivatives are zero). We will also use local Riemann normal coordinates and as a consequence, the A^a will also be constant along the integral curves of A (the geodesics in an RNC are always of the form $x^a(s) = sA^a$ for some affine parameter s on the geodesic). Let df/ds be the directional derivative of the function f along the geodesics defined by A^a and assume that s is the proper length along the geodesic (although any affine parameter would be sufficient).

Thus at the origin we have, by choice,

$$0 = B^a{}_{b,c} = B^a{}_{b,cd} = B^a{}_{b,cde} = \ldots$$

$$0 = dA^a/ds = d^2A^a/ds^2 = d^3A^a/ds^3 = \ldots$$

$$0 = A^a{}_{,b}A^b = \left(A^a{}_{,b}A^b\right)_{,c} A^c = \left(\left(A^a{}_{,b}A^b\right)_{,c} A^c\right)_{,d} A^d$$

$$0 = A^a{}_{;b}A^b = \left(A^a{}_{;b}A^b\right)_{;c} A^c = \left(\left(A^a{}_{;b}A^b\right)_{;c} A^c\right)_{;d} A^d$$

$$df/ds = f_{,a}A^a = f_{;a}A^a$$

$$d^2f/ds^2 = \left(f_{,a}A^a\right)_{,b} A^b = \left(f_{;a}A^a\right)_{;b} A^b$$

$$d^3f/ds^3 = \left(\left(f_{,a}A^a\right)_{,b} A^b\right)_{,c} A^c = \left(\left(f_{;a}A^a\right)_{;b} A^b\right)_{;c} A^c$$

I admit I've gone overboard here in writing out more than I need to but it's handy to have all of these equations laid bare in one convenient place.

Now put $f = R^p{}_{abq} B^q{}_p A^a A^b$. Then upon taking successive derivatives, while taking full advantage of the asummptions just noted, we can eaily see that

$$\left(R^a{}_{cdb} B^b{}_a\right)_{;\underline{e}} A^c A^d A^{\underline{e}} = \left(R^a{}_{cdb}\right)_{,\underline{e}} B^b{}_a A^c A^d A^{\underline{e}} \tag{2}$$

This is the equation that will be computed by the following Cadabra code. All of the compuations will be carried out on the left hand side (in the first version of the paper I swapped the left and righ hand sides).

We will need the successive covariant derivatives of B. The first covariant derivative is just

$$B^a{}_{b;c} A^c = \Gamma^a{}_{dc} B^d{}_b A^c - \Gamma^d{}_{bc} B^a{}_d A^c$$

The quantities on the left hand side are the components of a tensor so further covariant derivatives of the right hand side can be computed (despite the presence of the Γ's) by application of the usual rule for a covariant derivative of a mixed tensor.

Stage 1: Symmetrised partial derivatives of R

The first stage involves the expansion of the left side of (2). This leads to expressions for the symmetrized partial derivatives of R_{abcd} in terms of the symmetrized covariant derivatives of R_{abcd} and $B^a{}_b$.

$$\begin{aligned}
\left(R^a{}_{cdb}\right)_{,e} B^b{}_a A^c A^d A^e &= -A^a A^b A^c B^d{}_e \nabla_a R_{bfcd} g^{ef} - A^a A^b A^c R_{afbd} \nabla_c B^d{}_e g^{ef} \\
\left(R^a{}_{cdb}\right)_{,ef} B^b{}_a A^c A^d A^e A^f &= -2\, A^a A^b A^c A^d \nabla_a B^e{}_f \nabla_b R_{cedg} g^{fg} - A^a A^b A^c A^d B^e{}_f \nabla_a (\nabla_b R_{cedg})\, g^{fg} - A^a A^b A^c A^d R_{aebg} \nabla_c (\nabla_d B^e{}_f)\, g^{gf} \\
\left(R^a{}_{cdb}\right)_{,efg} B^b{}_a A^c A^d A^e A^f A^g &= -3\, A^a A^b A^c A^d A^e \nabla_a R_{bfch} \nabla_d \left(\nabla_e B^f{}_g\right) g^{hg} - 3\, A^a A^b A^c A^d A^e \nabla_a B^f{}_g \nabla_b (\nabla_c R_{dfeh})\, g^{gh} \\
&\quad - A^a A^b A^c A^d A^e B^f{}_g \nabla_a (\nabla_b (\nabla_c R_{dfeh}))\, g^{gh} - A^a A^b A^c A^d A^e R_{afbh} \nabla_c \left(\nabla_d \left(\nabla_e B^f{}_g\right)\right) g^{hg}
\end{aligned}$$

Stage 2: Symmetrised covariant derivatives of B

In this stage the symmetrized covariant derivatives of $B^a{}_b$ are computed in terms of its partial derivatives (which by choice are all zero) and the connection and its partial derivatives (which in general are not zero).

$$
\begin{aligned}
A^{c}\nabla_{c}\left(B^{a}{}_{b}\right) &= \Gamma^{a}{}_{pq}B^{p}{}_{b}A^{q} - \Gamma^{p}{}_{bq}B^{a}{}_{p}A^{q} \\
A^{d}A^{c}\nabla_{d}\left(\nabla_{c}\left(B^{a}{}_{b}\right)\right) &= A^{c}\partial_{c}\Gamma^{a}{}_{pq}B^{p}{}_{b}A^{q} - A^{c}\partial_{c}\Gamma^{p}{}_{bq}B^{a}{}_{p}A^{q} + \Gamma^{a}{}_{cd}\Gamma^{c}{}_{pq}B^{p}{}_{b}A^{d}A^{q} - 2\,\Gamma^{a}{}_{cd}\Gamma^{p}{}_{bq}B^{c}{}_{p}A^{d}A^{q} + \Gamma^{c}{}_{bd}\Gamma^{p}{}_{cq}B^{a}{}_{p}A^{d}A^{q} \\
A^{e}A^{d}A^{c}\nabla_{e}\left(\nabla_{d}\left(\nabla_{c}\left(B^{a}{}_{b}\right)\right)\right) &= A^{c}A^{e}\partial_{ce}\Gamma^{a}{}_{pq}B^{p}{}_{b}A^{q} - A^{c}A^{e}\partial_{ce}\Gamma^{p}{}_{bq}B^{a}{}_{p}A^{q} + A^{c}\partial_{c}\Gamma^{a}{}_{de}\Gamma^{d}{}_{pq}B^{p}{}_{b}A^{e}A^{q} + A^{c}\Gamma^{a}{}_{cd}\partial_{e}\Gamma^{d}{}_{pq}B^{p}{}_{b}A^{e}A^{q} \\
&\quad - 2\,A^{c}\partial_{c}\Gamma^{a}{}_{de}\Gamma^{p}{}_{bq}B^{d}{}_{p}A^{e}A^{q} - 2\,A^{c}\Gamma^{a}{}_{cd}\partial_{e}\Gamma^{p}{}_{bq}B^{d}{}_{p}A^{e}A^{q} + A^{c}\partial_{c}\Gamma^{d}{}_{be}\Gamma^{p}{}_{dq}B^{a}{}_{p}A^{e}A^{q} + A^{c}\Gamma^{d}{}_{bc}\partial_{e}\Gamma^{p}{}_{dq}B^{a}{}_{p}A^{e}A^{q} \\
&\quad + \Gamma^{a}{}_{ce}A^{c}\partial_{f}\Gamma^{e}{}_{pq}B^{p}{}_{b}A^{f}A^{q} - \Gamma^{a}{}_{ce}A^{c}\partial_{f}\Gamma^{p}{}_{bq}B^{e}{}_{p}A^{f}A^{q} + \Gamma^{a}{}_{cd}\Gamma^{c}{}_{ef}\Gamma^{e}{}_{pq}B^{p}{}_{b}A^{d}A^{f}A^{q} - 3\,\Gamma^{a}{}_{cd}\Gamma^{e}{}_{bf}\Gamma^{c}{}_{pq}B^{p}{}_{e}A^{d}A^{f}A^{q} \\
&\quad + 3\,\Gamma^{a}{}_{cd}\Gamma^{e}{}_{bf}\Gamma^{p}{}_{eq}B^{c}{}_{p}A^{d}A^{f}A^{q} - \Gamma^{c}{}_{be}A^{e}\partial_{f}\Gamma^{a}{}_{pq}B^{p}{}_{c}A^{f}A^{q} + \Gamma^{c}{}_{be}A^{e}\partial_{f}\Gamma^{p}{}_{cq}B^{a}{}_{p}A^{f}A^{q} - \Gamma^{c}{}_{bd}\Gamma^{e}{}_{cf}\Gamma^{p}{}_{eq}B^{a}{}_{p}A^{d}A^{f}A^{q}
\end{aligned}
$$

Stage 3: Impose the Riemann normal coordinate condition on covariant derivs of B

Here we impose the RNC condition (that $\Gamma = 0$ while $\partial\Gamma \neq 0$).

$$
\begin{aligned}
A^{c}\nabla_{c}\left(B^{a}{}_{b}\right) &= 0 \\
A^{d}A^{c}\nabla_{d}\left(\nabla_{c}\left(B^{a}{}_{b}\right)\right) &= A^{c}\partial_{c}\Gamma^{a}{}_{pq}B^{p}{}_{b}A^{q} - A^{c}\partial_{c}\Gamma^{p}{}_{bq}B^{a}{}_{p}A^{q} \\
A^{e}A^{d}A^{c}\nabla_{e}\left(\nabla_{d}\left(\nabla_{c}\left(B^{a}{}_{b}\right)\right)\right) &= A^{c}A^{e}\partial_{ce}\Gamma^{a}{}_{pq}B^{p}{}_{b}A^{q} - A^{c}A^{e}\partial_{ce}\Gamma^{p}{}_{bq}B^{a}{}_{p}A^{q}
\end{aligned}
$$

Stage 4: Replace covariant derivs of B with partial derivs of Γ

This stage uses the results from the second stage to eliminate the ∇B terms from the results of the first stage. This produces expressions for the symmetrized partial derivatives of R_{abcd} in terms of the symmetrized covariant derivatives of R_{abcd} and the partial derivatives of the connection. In this stage we also set the $B^{a}{}_{b}$ to equal 1.

$$
\begin{aligned}
\left(R^{a}{}_{cdb}\right)_{,e}A^{c}A^{d}A^{e} &= -A^{c}A^{d}A^{e}\nabla_{c}R_{dfeb}g^{af} \\
\left(R^{a}{}_{cdb}\right)_{,ef}A^{c}A^{d}A^{e}A^{e} &= A^{c}A^{d}A^{e}A^{f}\left(-\nabla_{cd}R_{ebfg}g^{ag} - R_{cgdh}\partial_{e}\Gamma^{g}{}_{bf}g^{ha} + R_{cbdg}\partial_{e}\Gamma^{a}{}_{hf}g^{gh}\right) \\
\left(R^{a}{}_{cdb}\right)_{,efg}A^{c}A^{d}A^{e}A^{f}A^{g} &= A^{c}A^{d}A^{e}A^{f}A^{g}\left(-3\,\nabla_{c}R_{dhei}\partial_{f}\Gamma^{h}{}_{bg}g^{ia} + 3\,\nabla_{c}R_{dbeh}\partial_{f}\Gamma^{a}{}_{ig}g^{hi} - \nabla_{cde}R_{fbgh}g^{ah} - R_{chdi}\partial_{ef}\Gamma^{h}{}_{bg}g^{ia} + R_{cbdh}\partial_{ef}\Gamma^{a}{}_{ig}g^{hi}\right)
\end{aligned}
$$

Stage 5: Replace partial derivs of Γ with partial derivs of R

The fifth stage draws in results from `dGamma.tex` to replace the partial derivatives of Γ with partial derivatives of R_{abcd}.

$$
\begin{aligned}
(R^{a}{}_{cdb})_{,e}\, A^{c}A^{d}A^{e} &= -\, A^{c}A^{d}A^{e}\nabla_{c}R_{dfeb}g^{af} \\
(R^{a}{}_{cdb})_{,ef}\, A^{c}A^{d}A^{e}A^{f} &= -\, A^{c}A^{d}A^{e}A^{f}\nabla_{cd}R_{ebfg}g^{ag} - \frac{1}{3}\, A^{c}A^{d}A^{e}A^{f}R_{cgdh}R^{g}{}_{feb}g^{ha} + \frac{1}{3}\, A^{c}A^{d}A^{e}A^{f}R_{cbdg}R^{a}{}_{feh}g^{gh} \\
(R^{a}{}_{cdb})_{,efg}\, A^{c}A^{d}A^{e}A^{f}A^{g} &= -\, A^{c}A^{d}A^{e}A^{f}A^{g}R^{h}{}_{gfb}\nabla_{c}R_{dhei}g^{ia} + A^{c}A^{d}A^{e}A^{f}A^{g}R^{a}{}_{gfh}\nabla_{c}R_{dbei}g^{ih} - A^{c}A^{d}A^{e}A^{f}A^{g}\nabla_{cde}R_{fbgh}g^{ah} \\
&\quad - \frac{1}{2}\, A^{c}A^{d}A^{e}A^{f}A^{g}R_{chdi}\partial_{f}R^{h}{}_{geb}g^{ia} + \frac{1}{2}\, A^{c}A^{d}A^{e}A^{f}A^{g}R_{cbdh}\partial_{f}R^{a}{}_{gei}g^{hi}
\end{aligned}
$$

Stage 6: Replace partial derivs of R with covariant derivs of R

The final stage is to eliminate the ∂R by using earlier results. For example, in the equation for $\partial^3 R$ we see terms involving ∂R. These first order partial derivatives can be replaced with the expression previously computed for ∂R in terms of ∇R.

$$
\begin{aligned}
(R^{a}{}_{cdb})_{,e}\, A^{c}A^{d}A^{e} &= A^{c}A^{d}A^{e}\nabla_{c}R_{bdef}g^{af} \\
(R^{a}{}_{cdb})_{,ef}\, A^{c}A^{d}A^{e}A^{e} &= A^{c}A^{d}A^{e}A^{f}\nabla_{cd}R_{befg}g^{ag} \\
(R^{a}{}_{cdb})_{,efg}\, A^{c}A^{d}A^{e}A^{f}A^{g} &= -\frac{1}{2}\, A^{c}A^{d}A^{e}A^{f}A^{g}R_{bcdh}\nabla_{e}R_{figj}g^{ai}g^{hj} + \frac{1}{2}\, A^{c}A^{d}A^{e}A^{f}A^{g}R_{chdi}\nabla_{e}R_{bfgj}g^{ah}g^{ij} + A^{c}A^{d}A^{e}A^{f}A^{g}\nabla_{cde}R_{bfgh}g^{ah}
\end{aligned}
$$

The end result are expressions for the symmetrized partial derivatives of R_{abcd} solely in terms of the symmetrized covariant derivatives of R_{abcd}.

Stage 6: Replace partial derivs of R with covariant derivs of R

```
# now eliminate remaining partial derivs of Rabcd by substitution from the lower order dRabcd

# note that
#   dRabcd01 = R^a_{cdb,e} A^c A^d A^e
#   dRabcd02 = R^a_{cdb,ef} A^c A^d A^e A^f
#   dRabcd03 = R^a_{cdb,efg} A^c A^d A^e A^f A^g

# thus we can use
#   dRabcd01 to eliminate 1st partial derivs of R in dRabcd03, dRabcd04, etc.
#   dRabcd02 to eliminate 2nd partial derivs of R in dRabcd04, dRabcd05, etc.
#   dRabcd03 to eliminate 3rd partial derivs of R in dRabcd05, dRabcd06, etc.

Geodesic BVP

Consider a geodesic that connects two points P_i and P_j with RNC coordinates x^a_i and x^a_j. Our aim is to construct a solution $x^a(s)$ of the geodesic equation such that $x^a(0) = x^a_i$ and $x^a(1) = x^a_j$.

We will do this in two stages. First we will solve

$$x^a_j = x^a_i + y^a - \sum_{k=2}^{\infty} \frac{1}{k!} \Gamma^a_{\underline{b}_k} y^{\cdot\underline{b}_k} \tag{1}$$

for y^a as an explicit polynomial in x^a_i and x^a_j. The functions $\Gamma^a_{\underline{b}_k}$ are the generalised connections for the RNC frame evaluated at $x^a = x^a_i$.

In the second stage, we will substitute our expression for y^a into

$$x^a(s) = x^a_i + s y^a - \sum_{k=2}^{\infty} \frac{1}{k!} \Gamma^a_{\underline{b}_k} y^{\cdot\underline{b}_k} s^k \tag{2}$$

to obtain the desired solution to the two point boundary value problem.

Stage 1: The fixed point iteration scheme

First we rewrite the main equation (1) in the suggestive form

$$y^a = \Delta x^a + \sum_{k=2}^{\infty} \frac{1}{k!} \Gamma^a_{\underline{b}_k} y^{\underline{b}_k}$$

where $\Delta x^a = x^a_j - x^a_i$. Our approximate solution for y^a will be taken to be the partial sums for the infinite series. Thus we will solve

$$\overset{n}{y}{}^a = \Delta x^a + \sum_{k=2}^{n} \frac{1}{k!} \Gamma^a_{\underline{b}_k} \overset{n}{y}{}^{\underline{b}_k}$$

for $\overset{n}{y}{}^a$. Note that in the last term of the sum, the $\Gamma^a_{\underline{b}_n}$ will contain curvature terms of order $\mathcal{O}\left(\epsilon^n\right)$. Thus in truncating the series at this point we will loose contributions to the curvature terms of order $\mathcal{O}\left(\epsilon^{n+1}\right)$ and higher. So to be consistent we must truncate all terms of the partial sum to order $\mathcal{O}\left(\epsilon^n\right)$ (i.e., exclude any contributions from terms $\mathcal{O}\left(\epsilon^{n+1}\right)$ and higher, these are the terms that would couple with the terms that we excluded when truncating the original infinite series). Let $\overset{k}{T}$ be the operator that truncates its argument to contain terms no higher than $\mathcal{O}\left(\epsilon^n\right)$. Then we have the following modified version of the equation for $\overset{n}{y}{}^a$

$$\overset{n}{y}{}^a = \Delta x^a + \sum_{k=2}^{n} \frac{1}{k!} \overset{k}{T} \left(\Gamma^a_{\underline{b}_k} \overset{n}{y}{}^{\underline{b}_k} \right)$$

Finally we note that since $\Gamma^a_{\underline{b}_k} = \mathcal{O}\left(\epsilon^k\right)$, we can use lower order estimates for the $\overset{k}{y}{}^a$ in the right hand side of the sum. This allows us to compute $\overset{n}{y}{}^a$ by successive approximations such as

$$\begin{aligned}
\overset{0}{y}{}^a &= \Delta x^a \\
\overset{2}{y}{}^a &= \overset{0}{y}{}^a + \frac{1}{2!}\overset{2}{T}\left(\Gamma^a_{bc}\,\overset{0}{y}{}^b\overset{0}{y}{}^c\right) \\
\overset{3}{y}{}^a &= \overset{0}{y}{}^a + \frac{1}{2!}\overset{3}{T}\left(\Gamma^a_{bc}\,\overset{2}{y}{}^b\overset{2}{y}{}^c\right) + \frac{1}{3!}\overset{3}{T}\left(\Gamma^a_{bcd}\,\overset{0}{y}{}^b\overset{0}{y}{}^c\overset{0}{y}{}^d\right) \\
\overset{4}{y}{}^a &= \overset{0}{y}{}^a + \frac{1}{2!}\overset{4}{T}\left(\Gamma^a_{bc}\,\overset{3}{y}{}^b\overset{3}{y}{}^c\right) + \frac{1}{3!}\overset{4}{T}\left(\Gamma^a_{bcd}\,\overset{2}{y}{}^b\overset{2}{y}{}^c\overset{2}{y}{}^d\right) + \frac{1}{4!}\overset{4}{T}\left(\Gamma^a_{bcde}\,\overset{0}{y}{}^b\overset{0}{y}{}^c\overset{0}{y}{}^d\overset{0}{y}{}^e\right) \\
\overset{5}{y}{}^a &= \overset{0}{y}{}^a + \frac{1}{2!}\overset{5}{T}\left(\Gamma^a_{bc}\,\overset{4}{y}{}^b\overset{4}{y}{}^c\right) + \frac{1}{3!}\overset{5}{T}\left(\Gamma^a_{bcd}\,\overset{3}{y}{}^b\overset{3}{y}{}^c\overset{3}{y}{}^d\right) + \frac{1}{4!}\overset{5}{T}\left(\Gamma^a_{bcde}\,\overset{2}{y}{}^b\overset{2}{y}{}^c\overset{2}{y}{}^d\overset{2}{y}{}^e\right) + \frac{1}{5!}\overset{5}{T}\left(\Gamma^a_{bcdef}\,\overset{0}{y}{}^b\overset{0}{y}{}^c\overset{0}{y}{}^d\overset{0}{y}{}^e\overset{0}{y}{}^f\right)
\end{aligned}$$

and so on. Note that there are no $\overset{1}{y}{}^a$ terms.

Stage 2: Introduce the generalised connections

This is the final stage – it introduces the generalised connecstion after the completion of the fixed point scheme.

All that needs be done is to substitute our expression for y^a into (2) to obtain the desired solution to the two point boundary value problem.

The generalised connections $\Gamma^a{}_{\underline{b}_k}$ are taken from the results of the `genGamma` code.

Stage 1: The fixed point iteration scheme

Geodesic IVP

Our game here is to find the solution of

$$0 = \frac{d^2x^a}{ds^2} + \Gamma^a_{bc}(x)\frac{dx^b}{ds}\frac{dx^c}{ds}$$

subject to the initial conditions $x^a(s) = x^a$ and $dx^a(s)/ds = \dot{x}^a$ at $s = 0$.

Algorithm

By successive differentiation of the above equation we can compute

$$\frac{d^nx^a}{ds^n} = -\Gamma^a_{\underline{d}_n}\frac{dx^{\underline{d}_n}}{ds}$$

at $s = 0$ for $n = 2, 3, 4, \ldots$. The $\Gamma^a_{\underline{d}_n}$ are the *generalised connections*.

We can then construct the Taylor series solution for $x^a(s)$

$$x^a(s) = x^a + s\dot{x}^a - \sum_{k=2}^{\infty}\frac{s^k}{k!}\Gamma^a_{\underline{d}_k}\dot{x}^{\underline{d}_k}$$

```
{a,b,c,d,e,f,g,h,i,j,k,l,m,n,o,p,q,r,s,t,u,v,w#}::Indices(position=independent).

Geodesic arc-length

Give a pair of points P and Q the geodesic arc-length can be computed using

$$L_{PQ} = \int_P^Q \left(g_{ab}(x) \frac{dx^a}{ds} \frac{dx^b}{ds} \right)^{1/2} ds \tag{1}$$

Since the path is a geodesic the integrand is constant and thus

$$L^2_{PQ} = g_{ab}(x) \frac{dx^a}{ds} \frac{dx^b}{ds} \bigg|_P \tag{2}$$

where s is a re-scaled parameter (0 at P and 1 at Q). The point P has RNC coordinates x^a while the point Q has coordinates $x^a + Dx^a$.

The vector dx^a/ds at P is given by the solution of the geodesic boundary value problem. This was found in the previous code (`geodesic-bvp`). That is

$$\frac{dx^b}{ds}\bigg|_P = y^a \tag{3}$$

and thus

$$L^2_{PQ} = g_{ab}(x) y^a y^b \tag{4}$$

It is possible to directly evaluate the right hand side of (4) using the results from the `geodesic-bvp` and `metric` codes. The result would need to be truncated (to an order consistent with the results form those codes). But doing so would be computationaly expensive as at least half of the terms will be thrown away. A better approach is compute just the terms that will survive the truncation. This is done by expanding $g_{ab}(x)$ and y^a as a truncated series in the curvatures and its derivatives.

The $g_{ab}(x)$ and y^a are written in a (truncated) formal power series in the curvature and its derivatives

$$y^a = \overset{0}{y}{}^a + \overset{2}{y}{}^a + \overset{3}{y}{}^a + \overset{4}{y}{}^a + \overset{5}{y}{}^a + \mathcal{O}\left(\epsilon^6\right) \tag{5}$$

$$g_{ab}(x) = \overset{0}{g}_{ab} + \overset{2}{g}_{ab} + \overset{3}{g}_{ab} + \overset{4}{g}_{ab} + \overset{5}{g}_{ab} + \mathcal{O}\left(\epsilon^6\right) \tag{6}$$

Note that this use of $\overset{i}{y}$ differs from that used in `geodesic-bvp`. Here the index above y^a denotes a particular term in the curvature expansion while in `geodesic-bvp` the index denoted the iteration number (in the fixed point scheme used to solve the BVP for y^a).

Stage 1

The formal curvature expansions are substituted into equation (4), expanded and truncated to retain terms of order $\mathcal{O}\left(\epsilon^5\right)$ or less. The expansion to 4th order terms is as follows.

$$L^2_{PQ} = \overset{0}{g}_{ab}\overset{0}{y}^a\overset{0}{y}^b + 2\,\overset{0}{g}_{ab}\overset{0}{y}^a\overset{2}{y}^b + \overset{2}{g}_{ab}\overset{0}{y}^a\overset{0}{y}^b + 2\,\overset{0}{g}_{ab}\overset{0}{y}^a\overset{3}{y}^b + \overset{3}{g}_{ab}\overset{0}{y}^a\overset{0}{y}^b + 2\,\overset{0}{g}_{ab}\overset{0}{y}^a\overset{4}{y}^b + \overset{0}{g}_{ab}\overset{2}{y}^a\overset{2}{y}^b + 2\,\overset{2}{g}_{ab}\overset{0}{y}^a\overset{2}{y}^b + \overset{4}{g}_{ab}\overset{0}{y}^a\overset{0}{y}^b$$

From `geodesic-bvp` (actually from `rnc2rnc which reformatted the results nicely`) we have

$$\overset{0}{y}^a = Dx^a$$

$$\overset{2}{y}^a = -\frac{1}{3}\,x^b Dx^c Dx^d g^{ae} R_{bcde}$$

$$\overset{3}{y}^a = x^b x^c Dx^d Dx^e \left(-\frac{1}{12}\,g^{af}\nabla_{d}R_{becf} - \frac{1}{6}\,g^{af}\nabla_{b}R_{cdef} + \frac{1}{24}\,g^{af}\nabla_{f}R_{bdce}\right) - \frac{1}{12}\,x^b Dx^c Dx^d Dx^e g^{af}\nabla_{c}R_{bdef}$$

$$\begin{aligned}\overset{4}{y}^a = {} & x^b x^c Dx^d Dx^e Dx^f \left(-\frac{2}{45}\,g^{ag}g^{hi}R_{bdeh}R_{cfgi} + \frac{1}{45}\,g^{ag}g^{hi}R_{bdeh}R_{cifg} - \frac{1}{45}\,g^{ag}g^{hi}R_{bdeh}R_{cgfi} + \frac{1}{45}\,g^{ag}g^{hi}R_{bdch}R_{egfi} - \frac{1}{60}\,g^{ag}\nabla_{de}R_{bfcg}\right.\\ & \left. - \frac{1}{40}\,g^{ag}\nabla_{db}R_{cefg} - \frac{1}{40}\,g^{ag}\nabla_{bd}R_{cefg} + \frac{1}{240}\,g^{ag}\nabla_{gd}R_{becf} + \frac{1}{240}\,g^{ag}\nabla_{dg}R_{becf}\right)\\ & + x^b x^c x^d Dx^e Dx^f \left(-\frac{4}{45}\,g^{ag}g^{hi}R_{befh}R_{cgdi} + \frac{2}{45}\,g^{ag}g^{hi}R_{bech}R_{difg} + \frac{1}{45}\,g^{ag}g^{hi}R_{bech}R_{dgfi} - \frac{1}{40}\,g^{ag}\nabla_{eb}R_{cfdg} - \frac{1}{40}\,g^{ag}\nabla_{be}R_{cfdg} - \frac{1}{20}\,g^{ag}\nabla_{bc}R_{defg}\right.\\ & \left. - \frac{1}{45}\,g^{ag}g^{hi}R_{bech}R_{dfgi} + \frac{1}{80}\,g^{ag}\nabla_{gb}R_{cedf} + \frac{1}{80}\,g^{ag}\nabla_{bg}R_{cedf}\right) + x^b Dx^c Dx^d Dx^e Dx^f \left(-\frac{1}{45}\,g^{ag}g^{hi}R_{bcdh}R_{egfi} - \frac{1}{60}\,g^{ag}\nabla_{cd}R_{befg}\right)\end{aligned}$$

and from `metric` we have

$$\overset{0}{g}_{ab} = g_{ab}$$

$$3\overset{2}{g}_{ab} = -\,x^c x^d R_{acbd}$$

$$6\overset{3}{g}_{ab} = -\,x^c x^d x^e \nabla_{c}R_{adbe}$$

$$180\overset{4}{g}_{ab} = x^c x^d x^e x^f \left(8\,g^{gh}R_{acdg}R_{befh} - 9\,\nabla_{cd}R_{aebf}\right)$$

Stage 2

The results from the `geodesic-bvp` and `metric` codes are read to provide values for the $\overset{n}{y}{}^a$ and $\overset{m}{g}{}_{ab}$. These are substituted into the result from Stage 1, et volia, the final answer. To 4th-order terms the result is given by

$$
\begin{aligned}
L^2_{PQ} = {} & g_{ab}Dx^aDx^b - \frac{1}{3}\,x^ax^bDx^cDx^dR_{acbd} - \frac{1}{12}\,x^ax^bDx^cDx^dDx^e\nabla_cR_{adbe} - \frac{1}{6}\,x^ax^bx^cDx^dDx^e\nabla_aR_{bdce} \\
& + \frac{1}{360}\,x^ax^bDx^cDx^dDx^eDx^f\left(-8\,g^{gh}R_{acdg}R_{befh} - 6\,\nabla_{cd}R_{aebf}\right) + \frac{1}{360}\,x^ax^bx^cDx^dDx^eDx^f\left(16\,g^{gh}R_{adbg}R_{cefh} - 9\,\nabla_{da}R_{becf} - 9\,\nabla_{ad}R_{becf}\right) \\
& + \frac{1}{360}\,x^ax^bx^cx^dDx^eDx^f\left(16\,g^{gh}R_{aebg}R_{cfdh} - 18\,\nabla_{ab}R_{cedf}\right) + \frac{1}{1080}\,x^ax^bx^cDx^dDx^eDx^fDx^g\left(-4\,g^{hi}R_{adeh}\nabla_fR_{bgci} - 24\,g^{hi}R_{adeh}\nabla_bR_{cfgi}\right. \\
& \qquad \left. + 10\,g^{hi}R_{adeh}\nabla_iR_{bfcg} + 16\,g^{hi}R_{adbh}\nabla_eR_{cfgi} - 4\,\nabla_{dea}R_{bfcg} - 4\,\nabla_{dae}R_{bfcg} - 4\,\nabla_{ade}R_{bfcg}\right) \\
& + \frac{1}{1080}\,x^ax^bDx^cDx^dDx^eDx^fDx^g\left(-18\,g^{hi}R_{acdh}\nabla_eR_{bfgi} - 3\,\nabla_{cde}R_{afbg}\right) \\
& + \frac{1}{1080}\,x^ax^bx^cx^dDx^eDx^fDx^g\left(24\,g^{hi}R_{aefh}\nabla_bR_{cgdi} + 24\,g^{hi}R_{aebh}\nabla_fR_{cgdi} + 24\,g^{hi}R_{aebh}\nabla_cR_{dfgi} - 6\,\nabla_{eab}R_{cfdg} - 6\,\nabla_{aeb}R_{cfdg} - 6\,\nabla_{abe}R_{cfdg}\right) \\

Geodesic mid-point for arc-length

This code uses the results of `geodesic-lsq` and `metric` to show that the 2nd and 3rd order estimates for L^2_{PQ} can be recovered using a mid-point estimate. For the 3rd order estimate we have

$$\begin{aligned} g_{ab}(x) &= g_{ab} - \frac{1}{3}\,x^c x^d R_{acbd} - \frac{1}{6}\,x^c x^d x^e \nabla_{\!c} R_{adbe} + \mathcal{O}\left(\epsilon^4\right) \\ L^2_{PQ} &= g_{ab} Dx^a Dx^b - \frac{1}{3}\,x^a x^b Dx^c Dx^d R_{acbd} - \frac{1}{12}\,x^a x^b Dx^c Dx^d Dx^e \nabla_{\!c} R_{adbe} - \frac{1}{6}\,x^a x^b x^c Dx^d Dx^e \nabla_{\!a} R_{bdce} + \mathcal{O}\left(\epsilon^4\right) \end{aligned}$$

The code below verifies that

$$L^2_{PQ} = g_{ab}(\bar{x}) Dx^a Dx^b + \mathcal{O}\left(\epsilon^4\right)$$

where $\bar{x}$ is the *coordinate* midpoint of the geodesic

$$\bar{x}^a = \frac{1}{2}\left(x^a_P + x^a_Q\right)$$

This result holds true only for the 2nd and 3rd order estimates. Note that the *coordinate* midpoint is not the *geometric* midpoint of the geodesic.

It might be interesting to see if the higher order estimates could be recovered by sampling the metric at points other than the mid point.

Converting from generic to rnc coordinates

The following is based on the approach used in the `geodesic-bvp.tex` code. The main difference here is that this time we will *not* be assuming that the coordinates are in Riemann normal form. This will be apparent in the expression for the generalised connections – they will be expressed in terms of the partial derivatives of the connection rather the covariant derivatives of the Riemann tensor. There will also be a change in the way the Taylor series are developed. In this case the expansion parameter ϵ will be associated with the connection and its derivatives rather than the Riemann tensor. We will use

$$\Gamma^a{}_{bc} = \mathcal{O}\left(\epsilon\right)\ , \qquad \Gamma^a{}_{bc,d} = \mathcal{O}\left(\epsilon^2\right)\ , \qquad \Gamma^a{}_{bc,de} = \mathcal{O}\left(\epsilon^3\right)\ , \qquad \text{etc.}$$

The generalised connections are defined recursively by

$$\Gamma^a{}_{b\underline{c}d} = \Gamma^a{}_{(b\underline{c},d)} - (n+1)\Gamma^a{}_{p(\underline{c}}\Gamma^p{}_{bd)} \tag{1}$$

where $\underline{c}$ contains $n>0$ indices. It is easy to see from this equation that the generalised connections will behave much the same as the connection, that is

$$\Gamma^a{}_{bc} = \mathcal{O}\left(\epsilon\right)\ , \qquad \Gamma^a{}_{bcd} = \mathcal{O}\left(\epsilon^2\right)\ , \qquad \Gamma^a{}_{bcde} = \mathcal{O}\left(\epsilon^3\right)\ , \qquad \text{etc.}$$

This allows us to represent each generalised connection by a single expression (typically `GamNN`).

The situation is slighly different in `geodesic-bvp.tex`. In that code the connection and the generalised connection are expanded as a series in the Riemann tensor and its derivatives. Thus each connection is written in the form

$$\bar\Gamma^a{}_{\underline{c}_n} = \overset{0}{\bar\Gamma}{}^a{}_{\underline{c}_n} + \overset{1}{\bar\Gamma}{}^a{}_{\underline{c}_n} + \overset{2}{\bar\Gamma}{}^a{}_{\underline{c}_n} + \cdots + \overset{m}{\bar\Gamma}{}^a{}_{\underline{c}_n} \tag{2}$$

where $\underline{c}_n$ denotes a set of indices such as $c_1c_2c_3\dots c_n$. The terms of the RHS are each of a different weight in ϵ.

Stage 1: The generalised connections

The generalised connections $\Gamma^a{}_{\underline{c}_n}$ could be computed directly by successive application of equation (1). But a more effiecent method exists and its basis lies in the original definition of the generalised connections. Recall that the generalised connecstions arose when buidling a formal power series solution of the geodesic equation

$$0 = \frac{d^2x^a}{ds^s} + \Gamma^a{}_{bc}\frac{dx^b}{ds}\frac{dx^c}{ds} \tag{3}$$

The key idea was that the coeffcients c_n in the formal power series

$$x^a = c_0^a + sc_1^a + s^2 c_2^a + \cdots \tag{4}$$

could be computed using

$$c_n^a = \frac{1}{n!} \left.\frac{d^n x^a}{ds^n}\right|_{s=0} \tag{5}$$

with the second, third and higher derivatives of x^a found by successive differentiation of the geodesic equation. The generalised connections were introduced as part of this algorithm, leading to

$$c_n^a = -\left.\Gamma^a{}_{\underline{c}_n} A^{\cdot\underline{c}_n}\right|_{s=0} \qquad n = 2, 3, 4\cdots \tag{6}$$

and

$$\Gamma^a{}_{\underline{c}_{n+1}} A^{\cdot\underline{c}_{n+1}} = \frac{d}{ds}\left(\Gamma^a{}_{\underline{c}_n} A^{\cdot\underline{c}_n}\right) \tag{7}$$

with $d/ds = A^a \partial_a$, $A^a = dx^a/ds$ and $dA^a/ds = -\Gamma^a{}_{bc} A^b A^c$.

The upshot is that computing the $\Gamma^a{}_{\underline{c}_n} A^{\cdot\underline{c}_n}$ requires little more than successive rounds of differentiation (and a few substitutions for the derivaties of A^a).

Note that the coefficients c_0 and c_1 must be determined from the initial conditions. Suppose that $x^a = x_i$ at $s = 0$ then $c_0 = x_i^a$ while $c_1 = A^a$.

The Riemann normal coordinates of the point j (where $s = 1$) are introduced by setting

$$y^a = A^a \tag{8}$$

This leads to

$$x_j^a = x_i^a + y^a - \sum_{k=2}^{\infty} \frac{1}{k!} \Gamma^a{}_{\underline{b}_k} y^{\cdot\underline{b}_k} \tag{9}$$

Note that given two points i and j, the y^a would be found as a root of this non-linear equation for y^a.

Stage 2: The fixed point scheme for y^a

This second stage is almost exactly the same as the corresponding stage in `geodesic-bvp`. The difference here is that the generalised connections involve partial derivatives of the connection. In contsrat, the `geodesic-bvp` code is specfic to RNC and thus uses the generalised connections based on covariant derivatives of the Riemann tensor.

We begin this second stage by rewriting the equation (9) in the suggestive form

$$y^a = x^a_j - x^a_i + \sum_{k=2}^{\infty} \frac{1}{k!} \Gamma^a{}_{\underline{b}_k} y^{\cdot \underline{b}_k}$$

and then use this as the basis of a fixed point iteration scheme.

Start with the first approximation $y^a_1 = x^a_j - x^a_i = \Delta x^a$, then compute the successive approximations

$$\begin{aligned}
y^a_1 &= \Delta x^a \\
y^a_2 &= y^a_1 + \frac{1}{2!}\Gamma^a{}_{bc}\, y^b_1 y^c_1 \\
y^a_3 &= y^a_1 + \frac{1}{2!}\Gamma^a{}_{bc}\, y^b_2 y^c_2 + \frac{1}{3!}\Gamma^a{}_{bcd}\, y^b_1 y^c_1 y^d_1 \\
y^a_4 &= y^a_1 + \frac{1}{2!}\Gamma^a{}_{bc}\, y^b_3 y^c_3 + \frac{1}{3!}\Gamma^a{}_{bcd}\, y^b_2 y^c_2 y^d_2 + \frac{1}{4!}\Gamma^a{}_{bcde}\, y^b_1 y^c_1 y^d_1 y^e_1 \\
y^a_5 &= y^a_1 + \frac{1}{2!}\Gamma^a{}_{bc}\, y^b_4 y^c_4 + \frac{1}{3!}\Gamma^a{}_{bcd}\, y^b_3 y^c_3 y^d_3 + \frac{1}{4!}\Gamma^a{}_{bcde}\, y^b_2 y^c_2 y^d_2 y^e_2 + \frac{1}{5!}\Gamma^a{}_{bcdef}\, y^b_1 y^c_1 y^d_1 y^e_1 y^f_1
\end{aligned}$$

and so on. Not that the $\Gamma^a{}_{bc}$, $\Gamma^a{}_{bcd}$, $\Gamma^a{}_{bcde}$ etc. will all depend on the original coordinates x^a at the initial point (i.e., $P = x^a_i$).

Stage3: Introduce the generalised connections from Stage 1

This is the final stage – it introduces the generalised connecstion after the completion of the fixed point scheme.

The result will be an equation for the y^a in terms of the original coordinates x^a and the connections (and its derivatives) at a chosen point $s = 0$ (aka i).

The y^a define an RNC frame in the neighbourhood of the chosen point i.

Stage 1: The generalised connections

Convert from rnc to generic coordinates

The following code is based on the `gen2rnc.tex` code.

It is common to do some computations in a local RNC. Doing so makes various parts of the computations much easier to manage than in the original non-RNC coordinates. One simple example is the proof of the second Bianchi identities.

This code develops the inverse transformation, that is from the local RNC coordinates back to generic coordinates. The key equation (drawn form `gen2rnc.tex`) is

$$x_j^a = x_i^a + y^a - \sum_{k=2}^{\infty} \frac{1}{k!}\,\Gamma^a_{\underline{b}_k} y^{\cdot \underline{b}_k} \tag{1}$$

In `gen2rnc.tex` this equation was solved for the RNC coordinates y given the generic coordinates x_j and x_i. Here we will instead take x_i and y as given and use this equation to compute x_j. The first change we will make is to replace x_j with x (as the subscript j serves no useful purpose).

Thus our job will be to compute

$$x^a = x_i^a + y^a - \sum_{k=2}^{\infty} \frac{1}{k!}\,\Gamma^a_{\underline{b}_k} y^{\cdot \underline{b}_k} \tag{2}$$

given x_i and y. The generalised connections will be computed recursively by

$$\Gamma^a{}_{b\underline{c}d} = \Gamma^a{}_{(b\underline{c},d)} - (n+1)\Gamma^a{}_{p(\underline{c}}\Gamma^p{}_{bd)} \tag{3}$$

As noted in `gen2rnc.tex`, the generalised connections will scale with the expensions parameter ϵ according to

$$\Gamma^a{}_{bc} = \mathcal{O}\left(\epsilon\right)\ , \qquad \Gamma^a{}_{bcd} = \mathcal{O}\left(\epsilon^2\right)\ , \qquad \Gamma^a{}_{bcde} = \mathcal{O}\left(\epsilon^3\right)\ , \qquad \text{etc.}$$

From one RNC to another

Consider an RNC frame with RNC cooridnates x^a.

In the `geodesic-bvp` code the two point boundary value problem (for the geodesic connecting two points) was solved. There is a bonus in that calculation – it can be trivaly adapted to the case of transforming form one RNC into another.

The starting point is the basic equation for the geodesic connecting P (with coordinaties x^a) to Q (with coordinates $x^a + Dx^a$)

$$x^a(s) = x^a_i + sy^a - \sum_{k=2}^{\infty} \frac{1}{k!}\,\Gamma^a{}_{\underline{b}_k} y^{\underline{b}_k} s^k$$

The affine parameter s varies form 0 (at P) to 1 (at Q).

A new RNC frame, with origin at P, can be defined via the y^a with the coordinates of Q in the new RNC frame defined by y^a (since $s = 1$ at Q). Recall that in an RNC all geodesics through the origin are described by $y^a(s) = sy^a$. Thus the transformation from x^a to y^a satisfies

$$x^a = x^a_i + y^a - \sum_{k=2}^{\infty} \frac{1}{k!}\,\Gamma^a{}_{\underline{b}_k} y^{\underline{b}_k}$$

where the $\Gamma^a{}_{\underline{b}_k}$ are the generalised connections of the x^a frame evaluated at $x^a = 0$. This equation can be inverted to express y^a in terms of x^a. This computation is done in the `geodesic-bvp` code – we only quote the results here (at the end).

The new y^a frame has origin at P. Its coordinate axes are aligned with those (at P) of the origianl RNC frame. To see this just note that $\partial x^a/\partial y^b = \delta^a_b$ at P. Thus the metric at P in the new frame has values $g_{ab}(x)$ (i.e., exactly those of the original RNC frame). Note that this means that the coordinate axes of the new frame are not ncessarily orthogonal.

The calculations in this code are trivial. It uses the y^a found in `geodesic-bvp` as the basis of the transformation from x^a to y^a. Most of the code involves reformatting the y^a.

The determinant of the metric

Our game here is to compute (the leading terms) in $\det g$ of the metric in RNC form

$$\begin{aligned} g_{ab}(x) = g_{ab} &- \frac{1}{3}x^c x^d R_{acbd} - \frac{1}{6}x^c x^d x^e \nabla_c R_{adbe} + \frac{2}{45}x^c x^d x^e x^f R_{acdg} R_{befh} g^{gh} - \frac{1}{20}x^c x^d x^e x^f \nabla_{cd} R_{aebf} \\ &+ \frac{1}{45}x^c x^d x^e x^f x^g R_{acdh} \nabla_e R_{bfgi} g^{hi} + \frac{1}{45}x^c x^d x^e x^f x^g R_{bcdh} \nabla_e R_{afgi} g^{hi} - \frac{1}{90}x^c x^d x^e x^f x^g \nabla_{cde} R_{afbg} + \mathcal{O}\left(\epsilon^5\right) \end{aligned}$$

For the sake of simplicity let's assume that we are working in 3-dimensions. The following analysis is easily generalsied to other dimensions (and the final answers for $\det g$ and friends are unchanged).

Define ϵ^{abc}_{ijk} by

$$\epsilon^{abc}_{ijk} = \delta^a_i \delta^b_j \delta^c_k - \delta^b_i \delta^a_j \delta^c_k + \delta^c_i \delta^a_j \delta^b_k - \delta^c_i \delta^b_j \delta^a_k + \delta^b_i \delta^c_j \delta^a_k - \delta^a_i \delta^c_j \delta^b_k \tag{1}$$

It is easy to see that ϵ^{abc}_{ijk} is anti-symmetric in both its upper and lower indices. A trivial computation shows that for any 3×3 square matrix M_{ab},

$$\epsilon^{abc}_{123} M_{1a} M_{2b} M_{3c} = \left(\delta^a_1 \delta^b_2 \delta^c_3 - \delta^b_1 \delta^a_2 \delta^c_3 + \delta^c_1 \delta^a_2 \delta^b_3 - \delta^c_1 \delta^b_2 \delta^a_3 + \delta^b_1 \delta^c_2 \delta^a_3 - \delta^a_1 \delta^c_2 \delta^b_3\right) M_{1a} M_{2b} M_{3c} = \det M \tag{2}$$

This can be easily generalised to

$$\epsilon^{abc}_{ijk} M_{pa} M_{qb} M_{rc} = \begin{cases} \pm \det M & \text{when } (ijk) \text{ and } (pqr) \text{ are permutations of } (123) \\ 0 & \text{otherwise} \end{cases} \tag{3}$$

The $\pm$ sign in the above depends on the particular permutations of (ijk) and (pqr). If both permutations are even or both odd then the sign is $+1$ otherwise the sign is -1. The same arguments can also be applied to a matrix inverse N^{-1} leading to

$$\epsilon^{ijk}_{uvw} N^{pu} N^{qv} M^{rw} = \begin{cases} \pm \det N^{-1} & \text{when } (ijk) \text{ and } (pqr) \text{ are permutations of } (123) \\ 0 & \text{otherwise} \end{cases} \tag{4}$$

Note that the $\pm$ in this case will match exactly that for the case of $\det M$. Thus, multiplying both expressions and summing over all choices for (ijk) and (pqr) leads to

$$\sum_{\substack{(ijk) \\ (pqr)}} \left(\det N^{-1}\right) \det M = \epsilon^{ijk}_{uvw} N^{pu} N^{qv} M^{rw} \epsilon^{abc}_{ijk} M_{pa} M_{qb} M_{rc} \tag{5}$$

where the sum on the left hand side includes just those (ijk) and (prq) that are permutations of (123). There are 3! choices for (ijk) and 3! choices for (pqr) and thus the left hand side is easily reduced to $(3!)^2 \det M/\det N$ where $\det N = 1/\det N^{-1}$. For the right hand side notice that

$$\epsilon^{ijk}_{uvw}\epsilon^{abc}_{ijk} = 3!\,\epsilon^{abc}_{uvw} \tag{6}$$

which leads to

$$\det M = \frac{1}{3!}\det N \epsilon^{abc}_{uvw} M_{pa} M_{qb} M_{rc} N^{pu} N^{qv} N^{rw} \tag{7}$$

For our RNC metric we will set $N^{ab} = g^{ab}$ and $M_{ij} = g_{ij}(x)$. Since g^{ab} is of the form $\mathrm{diag}(-1,1,1,1)$ we have $\det g = -1$ and thus

$$\det g(x) = -\frac{1}{3!}\epsilon^{abc}_{ijk}\, g_{pa}(x)\, g_{qb}(x)\, g_{rc}(x)\, g^{ip} g^{jq} g^{kr} \tag{8}$$

The ϵ^{abc}_{ijk} can be constructed in Cadabra by applying the `asym` algorithm to the upper indices of $\delta^a_i\delta^b_j\delta^c_k$. Note that `asym` will include the 1/3! coeffcient as part of its output.

The following code computes $-\det g$ rather than $\det g$.

Note that Calzetta etal. use an opposite sign for R_{abcd} so when comparing the following results against Calzetta do take note of this flipped sign in R_{abcd}.

```

The metric determinant in Riemann normal coordinates

$$
\begin{aligned}
-\det g(x) = 1 - \frac{1}{3}\,x^a x^b R_{ab} - \frac{1}{6}\,x^a x^b x^c \nabla_a R_{bc} + \frac{1}{180}\,x^a x^b x^c x^d \left(-9\,\nabla_{ab} R_{cd} + 10\,R_{ab} R_{cd} - 2\,g^{ef} g^{gh} R_{aebg} R_{cfdh}\right) \\
+ \frac{1}{90}\,x^a x^b x^c x^d x^e \left(-\nabla_{abc} R_{de} + 5\,R_{ab} \nabla_c R_{de} - g^{fg} g^{hi} R_{afbh} \nabla_c R_{dgei}\right) + \mathcal{O}\left(\epsilon^6\right)
\end{aligned}
$$

The volume element in Riemann normal coordinates

If $-\det g(x)$ is non-negative then we also have

$$
\begin{aligned}
\sqrt{-\det g(x)} = 1 - \frac{1}{6}\,x^a x^b R_{ab} - \frac{1}{12}\,x^a x^b x^c \nabla_a R_{bc} + \frac{1}{360}\,x^a x^b x^c x^d \left(-9\,\nabla_{ab} R_{cd} + 5\,R_{ab} R_{cd} - 2\,g^{ef} g^{gh} R_{aebg} R_{cfdh}\right) \\
+ \frac{1}{360}\,x^a x^b x^c x^d x^e \left(-2\,\nabla_{abc} R_{de} + 5\,R_{ab} \nabla_c R_{de} - 2\,g^{fg} g^{hi} R_{afbh} \nabla_c R_{dgei}\right) + \mathcal{O}\left(\epsilon^6\right)
\end{aligned}
$$

The log of -detg in Riemann normal coordinates

Apart from the signs, this matches exactly the expression given by Calzetta etal. (eq. A14)

$$
\begin{aligned}
\log\left(-\det g(x)\right) = -\frac{1}{3}\,x^a x^b R_{ab} - \frac{1}{6}\,x^a x^b x^c \nabla_a R_{bc} + \frac{1}{180}\,x^a x^b x^c x^d \left(-9\,\nabla_{ab} R_{cd} - 2\,g^{ef} g^{gh} R_{aebg} R_{cfdh}\right) \\
+ \frac{1}{90}\,x^a x^b x^c x^d x^e \left(-\nabla_{abc} R_{de} - g^{fg} g^{hi} R_{afbh} \nabla_c R_{dgei}\right) + \mathcal{O}\left(\epsilon^6\right)
\end{aligned}
$$

```
cdblib.create ('detg2.export')

cdblib.put ('Ndetg',    Ndetg,    'detg2.export')
cdblib.put ('sqrtNdetg',sqrtNdetg,'detg2.export')
cdblib.put ('logNdetg', logNdetg, 'detg2.export')

checkpoint.append (Ndetg)
checkpoint.append (sqrtNdetg)
checkpoint.append (logNdetg)
```
